Is your start menu clear?

At the risk of being annoying and incarcerated, I have another question. I have been brought to the brink of insanity trying to find out what is causing my CPU to idle at 50% load. I've tried evrything, and though my computer is now a bit faster and more efficient, it still mocks me at 50%.

A couple of you have suggested re-booting, and "wiping everything off", also saying that this would be an "easy" solution.

I haven't done this in years, and the last time, I remember re-loading software

for two days solid. That leads me to believe that there is some way to re-boot, while indicating which programs you want to stay; a "soft" or "partial" re-boot.

Is this right, or am I facing re-loading every friggin' plug-in, program, etc.?

Help!

Using GHOST 2003 is the only way I have kept what little sanity I have.
I make images like this.

Winxp1.gho	raw xp install
Winxp2.gho	with Paris installed
Winxp3.gho	with Paris and 20 fav apps

Restoring an image takes 3 minutes typically, so I can play all I want and always get back to a milestone.

John

When you press "control-alt-delete" a pop-up screen shows all of the programs running your computer. Whenever you install anything, garbage gets placed on your Start-up menu. All of this becomes active on boot-up and takes up resources and most of it is unnecessary.

I have found that by turning off the startup altogether my computer runs best. Alternately you can go to the configuration utility and selectively turn off the items individually.
