Hey there, everyone. It's been a few years since I've been here. I just tried to fire up the ol' PARIS and am having trouble initializing the hardware. When PARIS loads and it says "initializing hardware resources" the clip lights on the Audio Inputs light up on the MEC, but then it reverts to the blinking INTERNAL clock light. The C-16 does nothing. Any ideas?

J.R. Taylor

reseat the EDS card, remove, clean and reseat the daughterboard, reseat ribbon connectors, remove scherzo drivers and reinstall, turn off all unused ports in bios(usb, serial, parallel), remove all other cards till you get it. remove/reinstall paris

that's all i can think of.

Thanks for your suggestions, John. I tried all of that except for messing with the bios. I'm actually not sure how to access the bios on this machine (Compaq Presario). I tried DEL, F1 and F2 (ones that work on other MOBOs). It seems strange that I don't get an error message in PARIS. Also, when I quit PARIS, the Input Clip LEDs light up again.

Isn't there a PARIS log file that might help diagnose the problem? I remember seeing that before (back in the day), but I cannot locate it now. Where might I find it?

How to report errors to ID:

=====

1) Generate application messages with this occurring and send me the app messages file? The procedure for this is below:

Win9x:

- Right click on PARIS app icon to get menu,
- Click with left button on open, but don't let go,
- Hold down control and alt,
- Let go (launch),
- When you see the window at the bottom of the screen you can let go of alt/control.

After you produce the problem quit PARIS. You will see a file named "AppMessages.txt" in the PARIS application folder.

- Send support@intdevices.com the AppMessages.txt file content with

DETAILED description of system and problem.

=====

one step further, if youve got a client in a few hours,  
then you might find it useful to at least have a bare bones  
paris running. think of it as "safe mode" - you should

1. deactivate the VST plugins (just drag the content of your VST plugin  
folder into a subfolder called "were closed today" or something ;)

2. deactivate the direct x plugins. in the paris.cfg file, theres a line  
saying:

```
DisableDirectX=0
```

change that to 1. or vice versa, if its 1, change it to 0,  
not sure which one was which.

3. fwiw, just in case, you can even disable the paris fx, which  
should disable the EDS daughterboard. thats just a guess but  
still worth trying IMHO. heres a quote from an edmund post  
how to do it (i hope quoting edmund when its about stuff like that is ok :):

-----

Put the following line:

```
TestFXEnabled=0
```

=====

Assertion Error

```
Assertion failed File Cache.c:439offset>=0&&offset<p->count
```

This usually happens after something bad happens (like disk I/O error,  
corrupted file, etc). It shouldn't, and there are other error codes meant  
to intercept these situations, but when really bad things happen sometimes  
you will see assertion failures. They are controlled exits in catastrophic  
situations.

Now that I have scared the bejeezes out of you:

- Do a scan disk of all volumes with surface scan,
- Increase the disk cache by a meg or two,
- Let me know if this happens again.

=====

```
Error Initializing Paris Engine: Error Code 7/7          error 7/7  
means that paris can't see the EDS card
```

- (1) The EDS Card is lose
- or-
- (2) IRQ resource conflict

The MEC will flash until Paris has booted up, so that is normal. You're turning on the MEC first right and giving it 5 seconds before turning on the PC.

```
=====
Error in initializing Paris Engine.Error Code 1/1
Error in initializing Paris Engine.Error Code 40/28
=====
ERROR: error code 1007/3ef. because you forgot to install
media player which is a requirement for using Paris 1.81b
=====
Corrupted Default Project 'unhandled exception: c0000005 at
address: 00481382'
```

'Paris has caused an error in Paris.exe'

- 1. Delete or move the offending default project file out of the Paris directory.
- 2. Deinstall Paris.
- 3. Go to the windows system folder and
  - a. delete the directory that says Ensoniq if present
  - b. delete the file Paris\_StudioControlLibrary.dll if present
  - c. Reinstall Paris
- 4. Start with one card.
- 5. If necessary, go to plain vanilla sytem, meaning ALL cards removed except for video and 1-EDS. Once that is working, start adding others one at a time until all is working.

I am not suspecting your card swapping for the moment because it sounds like the hardware initialized, but then could not open the default\_project.ppj.

This makes me think it was a corrupted ppj file, or other corrupted Paris components. Hence the above advice.

Some things to make note of:

- 1. Did Paris work initially with your new advancesys scsi card or did it stop working immediately after you installed the new card?
  
- 2. If you remove the advancesys and put everything else back where it was before, does it all work fine? (you may need to force a PnP update via your bios)

=====

> 1. Ive been getting errors that say something along the lines of "Ran  
> out of memory for disk transfers." This seems to happen after intense  
> recording and punching-ins in freeform mode. It happens about once every  
> 4 to 6 hour sessions and I generally save my project after getting this  
> error and re-start my computer. Though not reeealy annoying, is there  
> any way of eliminating this problem? I'm running PARIS at about 55 meg  
> of RAM (on a Mac).

What you need to do is increase the disk cache size under Preferences. Try increasing this number by 1-2 MB at a time until the errors go away.

=====  
ERROR: EDS Cards are not connected properly You may experience  
playback problems

You just need to criss cross the two 16 pin cables and connect the 10  
pin straight across. That message definitely means the cables are wrong.

=====  
ERROR: Error code on new EDS install- Error 61/-3D  
=====  
error in playback 1879048195/70000003"

Do you have a stereo plugin strapped accross 2 tracks of unequal lengths?

Joe, Sure enough, you were right. I checked a few edits, and there was one  
fade that was off by just a touch. I fixed this, and I'm back in business.  
Thanks for the suggestion.

This is a new one on me. Usually if there is an unequal fade problem with a  
stereo plug-in, the error shows up only when the now line is approaching  
that point. On this one, however, I could put the cursor 6 minutes before  
that edit, or 6 minutes after it where there were no audio files playing,  
and it would still happen.

=====  
Started to get error code: error in queing project. Error code  
1879048233/70000029 every time I try to record.  
Does anyone know what this means? I did a search and found others who  
had the problem, but no answers as to why.

Try resetting the record path to a new empty folder.  
Or if you are on the Mac and running anything before OS 9 you may have  
run out of open files (MacOS limit). If this is the case try clearing  
unused files from the audio window.

=====  
Streaming Errors:  
I've done some more experimenting. I lowered the vcache min and max to  
8192, and the streaming errors returned. I set the values to 32768, and  
voila -- no more streaming errors.

Wow! Thanks! That should keep me busy. Thankfully, there is no

urgency to fix this. I have been using Digital Performer since '02. I'd like to get PARIS going again to bring back some of my personal stuff that I never had time to move over... Anyway, I'll post any updates here. Thanks again!

J.R.,

Didn't we meet back around 1999 over at my place on Westlake Drive? I think I remember you from somewhere.

Regards

Deej

Hi Doug! Yeah, we met at Musicmakers, when the Ensoniq (or was it Emu?) rep was there. Never made it out to your place before you moved, though. It's nice to see familiar names here on the old newsgroup, even after 4 years. It's quite nostalgic, really. :)

Yeah! Now I remember. Good to see you coming back around here.

Cheers,

DJ
