Subject: Can any "scientist" of "Logic 5"(PC) try to help me a bit?

Hi,
sorry to disturb for a non-Paris issue;
maybe some Logic 5 user can help me.
Days ago i put some Vst plug-ins in various Logic's mixer "Audio instrument" channels to control their params by external midi keyboard(this is a tip not known by all folks..!),initially it all worked fine. Then something gone wrong and i found them un-available and disappeared from the list of available plug-ins, and i can't get them back.
I don't remember exactly what i did (was late night!), but i guess the trouble is caused either by:

1)switching monitoring audio from ASIO(Paris' interfaces as recording into Logic) to my pc souncard, and back.

2)using "non-universal" mode under "Audio hardware and settings"(i was working on a Vocoder plug-in path, too...)

Problem is, so far i can't understand exactly how to make the plugs be present and work again.

Thanks all

Heya Andrea - what is it that disappeared? The objects in Logic's Environment? Or all your VST plugs in Logic? I'm not a Logic 5 PC user but I am a longterm Logic user, maybe we can figure this out if you can describe it in a bit more detail.

By the way - check out Reaper, it's *way* more up to date than Logic and has some really cool PARIS-related functionality.
