<http://www.ardour.org/manual/editing/importing>

The list of audio file formats that Ardour can import/embed is quite long. It is based on the functionality offered by libsndfile, an excellent and widely used software library by Australian programmer Erik de Castro Lopo. As libsndfile's capabilities expand, so will Ardour's abilities to import (and export) new formats. Ogg/Vorbis (an excellent, unpatented and license free audio compression format similar to MP3) is planned for the near future. Currently, supported formats include:

Microsoft WAV  
SGI/Apple AIFF/AIFC  
Sun AU/Snd  
Raw (headerless)  
Paris Audio File (PAF)  
Commodore IFF/SVX  
Sphere/NIST WAV  
IRCAM SF  
Creative VOC  
SoundForge W64  
GNU Octave MAT4/5  
Portable Voice Format  
Fasttracker 2 XI  
HMM Tool Kit HTK

I've had an eye on Ardour for a while. Actually downloaded the source from their SVN repo. As Doug (I think) mentioned, it has some warts. Also, it's no small trick to support something TOTALLY proprietary like VST (f/x or VSTi) on a GPL'd project. Still, I have my eye on it, and I'll continue to do so.
