I thought I would share with you some of the things I learned in my first Windows Vista experience.

Firstly, the basic OS layout seems quite similar to XP and previous Windows versions. Some things have been graphically shunted around, but conceptually the menus appeared to be very similar in content. The "Start" button is now just a ball with a Windows logo on it, but you know what it is from its location at the bottom left. Other things have changed in a similar way. Clicking on this "Start" button, which I presume may have a new name as the word "Start" is now absent, brings up a menu which includes what I think is a fairly nifty scrolling window, in which your "All Programs" menu appears. Hence "All Programs" is always visible, and doesn't branch off across your main monitor like it used to. It's another of the apparently many gui changes which appear to have been designed fairly well in terms of improving functionality while having a fairly easy learning curve. At this end the OS is nice it seems.

And then you use it. ;o)

Even if you haven't seen the Mac ads, I'm sure you have heard somebody talk about...

"An unauthorised program is attempting yada yada - Allow / Decline"

Well, welcome to the future.

I wasn't surprised to get this program when installing software. I had been warned, and although my mouse click on install was just a fraction of a second before the Allow / Decline prompt, bringing forth questions as to how quickly doubt can occur about such things, I accepted that you don't install software all that often, and being very system critical it doesn't hurt to double check.

It was a couple of minutes later when I became apparent that people weren't kidding.

While I was dismayed when the USB stick, which I had just removed from an XP machine which confirmed files onboard, showed up, but was reported as empty. That was odd. Removing it, rechecking the files in XP, and then putting it back, did, for whatever reason, cause Vista to display the files.

One of them was a ZIP file, and I needed to copy some stuff from the ZIP file to an area where it would no longer be zipped. Initially it was about 1.5MB worth of stuff.

Select.

Copy.

Paste.

An unauthorised program is attempting to...

....huh?

Which program? Windows Vista itself? It seemed so. A simple file copy, admittedly from a compressed archive, was sufficient to claim that authorisation was required.

Allow.

Now copying 1.5 meg.

Estimated time remaining: 2 minutes 13 seconds.

Speed: 8.2KB/sec

1.5Meg will take over two minutes? We're getting 8.2KB on a 480,000KB bus?  
Even USB 1 is 10,000KB. Nice.

And it didn't disappoint. It really did use the whole 2 minutes.

A later file copy of just over 4 meg achieved a speed of about 70KB/sec, nearly 10 times faster, and only about 7,000 times slower than expected (literally).

It is, it seems, appropriate, for your own security, that you are inflicted with constant, annoying, inconvenient checks and tests. It's for your safety. Sorry sir. Do you have a bomb? You'll have to take your clothes off while I put on this glove...

....it's for your own safety...

....because all of us...

....would prefer...

....a glove an hour...

....to a bomb that rarely occurs...

Welcome to Windows Fista. The future is more paranoid than ever. The bad guys will never get us. They can't annoy us. No they can't.

Cheers,  
Kim.

ROFL! good one.

Yeah, DRM to the max, and now this. Looks like the end of the road for Windoze DAW's was XP - after our current rigs are no longer viable, it's gonna have to be PT on a Mac, I'm sure.

Your USB stick worked? Vista says it can't find drivers for any of mine -  
I've tried three; also tried a Logitech webcam that has it's own drivers  
that Vista can't find, even when I point directly to them. It randomly  
shuts off my USB audio interface for some apps and either mutes it, uses it  
for the system, but not apps, or vice versa, or somewhere in the middle....  
you get the idea.... yep, when I have time, Vista's getting punted for  
Ubuntu, or a Macbook.

> Welcome to Windows Fista. The future is more paranoid than ever. The bad

"...and we'll shut out the good guys, and pretty much anything you might do  
on a computer too.... just in case...."

I turned all of the security crap off on my laptop, but apparently without it, Vista is as blind as a bat at noon on Venus.

>I turned all of the security crap off on my laptop, but apparently without  
>it, Vista is as blind as a bat at noon on Venus.

So you can turn it off? Perhaps if they fix this feature the OS might be usable. I assume driver issues will be fixed in time, as that clearly can't go on, but this super security really is more than silly.

>"Windows Vista - ensuring the future for OSX and Linux."

Despite the Simpson's quote, this one actually isn't funny because it definitely seems to be true.

I seriously find it close to unfathomable that they could release something like this and think, it seems, that it will be successful. Why in the world would you deliberately design an OS to annoy the daylights out of you? Have the designers not used it? Have they not gone "Gee, this is annoying?". Are they such uber geeks that they think the more buttons you are forced to push the more fun it is?

I simply cannot fathom, no matter how I look at it, how a massive team of computer experts have gone this way. We've all heard reports of M\$ employees disagreeing with much of Vista's design, so I presume that someone high up, Bill among others, have forced this as the direction, but why?

I'm guessing that it is possible to make the OS tolerable by deactivating hyper-security mode, assuming you have direct access to M\$ support. Ignoring the constant stabbing pain in my soul caused by the incessant issues and prompts, the OS may be an improvement in some respects, but it sure has a long way to go.

My home Paris box runs an XP partition and a Ubuntu partition now. I like Ubuntu, though Linux still has some serious usability drawbacks if you push

technology at all. Even simple things like wireless security are very sketchy if you expect a simple up and go GUI rather than 4 hours reading advice on editing your configuration files in a text editor, which surprised the daylight out of me. I spent hours trying to find info which I was confident would allow me to get WPA working. It was clear that the job was large enough that I shouldn't start unless I was confident it would work, and I was unable to google a sufficiently confidence inducing explanation of the required changes. I ended up back on WEP, wondering why it is that some smart programming cookie hasn't gone "Ya know, I could almost make a gui for this quicker than I can manually make the changes".

Still, such issues will be solved in time, and not that much time I imagine, as high-annoyance issues on Ubuntu are actually not all that common. When you hit one it can waste hours, but general workflow in the OS is pretty smooth, and indeed I am surprised constantly by how much smoother than XP in can be on occasion. Little things like plugging in a printer, camera, or MP3 player, are almost always totally automated and you're up in seconds, with all the functionality you do want, and none of the garbage you don't. Aside from being highly configurable, the GUI can be totally replaced with multiple options. I'm still coming to terms with the location of system files, which I think is laid out in a very "geek" fashion and, quite frankly, probably only makes any sense if you understand the internals of Unix/Linux, which I have no desire to ever do.

I have a spare HDD partition with some 100+GB of space which might soon gain the label "MacOS" when I get a spare weekend to google around for the Intel version and check if it's going to sit OK with my hardware. And I'm quite willing to pay for it. I wonder how they would go taking you to court because you're running something you legally own on hardware they don't like. ;o)

We do appear suspiciously close to the end of an era in terms of Windows popularity though. DRM is another thing of course, which apparently is going to infiltrate all legally available OS's. I think we all know the Linux community will fight this fairly hard, and it seems unlikely to me that you won't, at least, be able to hack DRM from Linux with relative ease for a long time to come.

If not, it's not impossible that the OS's of the next couple of years will still be in use for decades, as the final OS's capable of "getting the job done".

Cheers,  
Kim.

Subject: Re: My Vista Rant & Ubuntu comments  
Posted by [Erling](#) on Fri, 09 Nov 2007 12:25:01 GMT

I believe Vista have a long way to go when thinking of how many years we have payed to be betatesters for all kind of commercial software;-).

By the way, after nearly a year in use, I see the Service Pack One are on its way for Vista. After that, it's time to wait for Service Pack Two etc., etc., etc.....;-)

....So, maybe I think I'm old enough to have learned to wait a year or two before a new product is new for me...

....By the way, I buied Adobe Audition 3 today...

....and it's brand new today...

....I saw something written about it a month ago and wanted to own it after owning each version from CoolEditPro...

....So where have my logic mind gone???

....and I looked at this "new" homesite too yesterday:

<http://www.intelligentdevices.com/>

The only word I don't like to see here is the word "SOON"!!!!  
It will be show to see how far away the word "soon" will be here;-)

the problem relates to Vista making thumbnails of files, and trying to continue making them even when you have told it to delete a file, its not a transfer speed problem, and can be VERY easily stop gapped by disabling thumbnail views in the folder view settings :)

The wireless issues are a function of the hardware manufacturers, not Ubuntu or Debain (it's upstream, far geekier parent). If you want to do something about it you should talk to the people who make your wireless card and tell them to open their hardware enough so drivers can be written. Trust me, they will be done within days.

Also, WEP/WAP is a joke. When my DSL line goes down I break into someone else's 'secure' wireless network to check my email. It takes me five minutes unless they are doing MAC address filtering, which actually does help a lot.

Pretty much all of the config files for Ubuntu (and nearly all \*nix OSs) are in /etc somewhere. Once you're used to using them you'll never miss a confusing GUI config tool again, I promise.

Good luck, the Ubuntu forums are excellent and very newbie friendly. The Debian community is more technical but full of cranky old geeks who mock at you when you don't get their jokes written in hex.

Yes, welcome to the future... according to Microsoft.

Vista is giving both our developers and support personnel fits here at Xerox.

Especially, the 64-bit version.

Vista should sell more Intel Macs than anything Mr. Jobs could do.

Gotta say, just received a new MacBook Pro. Nicest computer I've ever used (and I go back to a wire-wrapped CP/M box with a hand-written BIOS).

I've got Leopard, and two XP VMs running concurrently under Parallels. Smooth as SILK. Welcome to the real future!

Rock on!

Mark
