[View Forum Message](#) <> [Reply to Message](#)

I hate it when this happens! I have two violins, viola, 'cello, bass, clarinet, piano and two singers waiting to record. Everything was fine when I turned the system on this morning. I walk into the control room to find the computer locked up. reboot and start Paris and I get - "error in initialization; Paris Engine. Error code -43/ffffffd5". Does anyone know what that means? I shut everything down and rebooted - same result. I switch boot volumes - different OS, different paris installation - same result. I switched my MEC to the EDS card that lives in my old computer and Paris booted fine so it must be a hardware problem.

I'm running Paris on a 1.25 GHz G4 (yup - a Mac guy) with 3 EDS cards in a Magma 13 slot expansion chassis. I guess the first step is to strip it down to one EDS card in the Magma to see if I can isolate a bad card.

Thank God I have multiply redundant redundancy systems running running here. Else I'd have some PISSED off people in my studio right now!

Moral of the story - Don't throw your old computer away! Keep one EDS card in it and have it for a spare...

So - any thoughts about what "error in initialization; Paris Engine. Error code -43/ffffffd5" means?

Gantt

Hey Gantt,

I'm guessing but check all connections to hardware, ribbon cables etc. You had to change them to get the old computer running so maybe . . .

Maybe reseal the EDS cards. Don't go too crazy yet.

Actually, to switch computers I didn't have to change anything but the MEC
and C16 connections from the Magma expander to the EDS card in the old computer.
I'll do some wiggling and re-seating before I start the really invasive
surgery...

Thanks!

I do the same thing - I have two dual card systems as things seem to creep in at the worst time.

Ditto on the connections - with me the MEC cables seem to lose connection over time. Once I even lost all sound on the left side - reseated the cable and boom came back...

I pulled the EDS card formerly known as card "A". Now Paris will boot but it won't open the "Default Project",

I get a message saying "an error occurred while reading the "Default Project" for new Project settings. A new empty Project will be created instead. There are not enough free resources available".

Then I get a message saying "error creating new project. There are not enough free resources available"

Then I try creating a new project and get a message saying "There is no source connected to this input channel."

Then Paris crashes. Every time. I have clients sitting in the tracking room talking while I try to figure this out. I'm not having any fun.

I just put an EDS card inside the computer and left the Magma box off. same result.

Where's Edmund when you need him?!?!?

I'm going off of memory here, but I believe that meant a dead EDS card. I remember Error Code 43 (3) times and all (3) times were dead EDS cards (bad chips).

Hi Brad,

Yeah, I think you're right. I pulled one of the cards and bow the error 43 is gone, but paris still isn't happy. See my most recent post. Any thoughts?

Thanks!

Gantt,

Go to the Paris.exe file in the Paris directory (if you are on PC.....I have no idea if you are on Mac) and launch Paris directly from that. then configure that project like you had your previous default project and save it as the new default project.

I've done the Mac equivalent of that. It gives me a bunch of error messages and then crashes.

Gantt,

If you're removing cards, external hardware, don't have a default =
project
available in your system! That royally screwed me I think on a PC.
Like DJ says, whatever you do with these changes, start Paris with
the .exe (whatever it's called on a Mac) and nothing else until things =
settle down.

I'm not convinced your EDS is trash either.

Tom

I've done the Mac equivalent of that. It gives me a bunch of error =
messages
and then crashes.

After MUCH futzing around w/ re-installing Paris, pulling cards out of the Magma, installing them inside the computer, putting them back in the Magma, and finally trashing the Default Project I'm up and running again.

Thanks for all the suggestions! God bless this newsgroup, one and all!
I'm pretty sure the original problem was a bad EDS card in the "A" slot.
Ill test my theory another time. I'm goin' to bed!

Glad you're up and running agina, at least. TheSoniq can probably fix your card.
