>Pete,  
If everything is black and no beep at power up, there can be so much that's  
doing the trouble. First of all I think you shall take of the powercable  
back on the computer and let it rest some minutes without any passive power  
at all. Controll all the cables to see that they're OK inside and outside  
and try starting once again. If nothing's yet happening and it's all black  
yet, there can be many different faults. First of all, control the  
powersupply that it's OK. If so, it can be a bad seated or collapsed graphic  
card or a collapsed chipset on the motherboard. It's not good to say at all,  
this is just some ideas I have that I know can make these kind of problems.

track dither and see what happens.

I have it from a very respected and reliable source that \*real men\* don't  
dither.....they truncate.

No, IMHO, \*truncation\* just sounds like a much more manly thing to  
do.....I mean, \*dither\*?????.....it sounds sort of like something a  
fairy would sprinkle on something.

1- Strip it down to a bare box, vid card, HD, Ram...etc  
2- Try swapping video card  
3- Try another pwr supply

If you still cant get a beep out of it at this point and this box was running perfectly before, I think you may need to go shopping for a new MoBrd my friend.

Good luck

o paris digital coax  
in.http://www.digitech.com/products/gnx4.htm

OK, so maybe the recorder in it doesn't sound as good as Paris. Sure, it's  
only 16 bit, and only 8 tracks...

....but it really is impressively easy to use. Convenient. Obviously no good for any actual release stuff, but for mucking around, excellent, and for looping... ;o)

Well looping is just the best. It's not actually the best looper in the world as such. Some features of dedicated loopers, like reverse for example, are absent. On the other hand you do get 8 tracks to loop on which isn't bad, and what I especially like is that it has track buttons like a proper recorder, so you can create 4 loops which play together, and then mute any one, or two, or whatever, and then bring those loops back later on if you like. This allows a lot of flexibility in terms of building a peice.

I especially like the way the thing works. With some peices of gear you just never get along with them and feel like it's a fight to get the job done, but others are intuitive and you find yourself agreeing with all the design decisions, and when you disagree, half an hour later you end up going "Ah, THAT's why they've done it that way!!". The GNX4 is one of the latter for me. How it's laid out makes sense to me. There's a lot to this box, and I reckon I've got a hold on about 3/4 of it or more already. That's not bad for two nights mucking about.

As far as the sounds go, I haven't plugged it in to Paris or anything yet to have a good listen, but so far the sounds have mostly impressed me. I've heard it said that the actual amp models on this box aren't entirely accurate, but that it's strength lies in the "WARP" feature, which allows you to make combinations of two seperate amp/cabinet setups. From what I've heard so far this does sound like a powerful tool. It does seem to be a true warp function, and some very effective results can be had by criss crossing between different cabinet models. I've heard there is a set of some 1000 odd presets you can now buy which utilise the warp feature, which I'm considering purchasing.

Even the virtual pickup settings seem to work quite well... humbucker to single coil and visa versa. I was expecting some cheap EQ effect, but whatever they've done sounds like it's much more effective.

I can't wait to hook it up to a keyboard and get the vocoder working. ;o)

Ah, the joy of a new toy...

Cheers,  
Kim.anyone know the latency on the lookahead settings... 0.01 - 0.050.

thanks!i have used that board but i never hooked up the onboard sound.

sorry.

My Digitech RP2000, a previous version of their amp modeler/FX pedal, is a real workhorse. It sounds good, is built solidly and has been very dependable for gigging with acoustic guitar, electric guitar and violin.

Cheers,  
-Jamie K

I've got a song that the band wants to edit in a major way ie: Cutting out and Adding sections. The problem is that the song has some major automation going on and the automations edits will have to be moved, cut or added.

Are there any tricks to doing this ie: "snap to object end" like in the edit window ?

If not I'm looking at one major cluster f-ck

DonThis is a multi-part message in MIME format.

Don,

I would choose your edit point and place a marker there.

Select and cut all objects and automation data at this point.

Now cut and paste should work for everything except mutes that cross that line. It has worked for me in the past. Surprisingly simple if you don't forget where you are in the process.=20
