I had this HD crash, took it in and they ran a utility on it so now it shows up again. However, this big tune that I spent a moth on won't open up. A dialog box comes up saying:
"Error in reading this project. There is not enough memory. Clearing the undo/redo buffer from the settings menu closing some windows may allow you to complete this operation".
Well.... with this song only, many of the options to click on under the Settings menu to include the undo/redo are greyed out, meaning you can't click on it. I need help!
Steve

Sadly I have no answer to your problem, just wanted you to know I feel your pain, as I've been living in HARD DRIVE HELL for the last week. Good luck, and I hope you find an answer soon.

Hmm... you're OS9, right? Maybe it's actually telling you the truth.

Did you reinstall PARIS after that crash? If so - check to see if the memory assigned to the application is still at the default value (select it in the Finder and do an "apple - I" and look at the numbers). If it is, double it (at least - depending on how much RAM you have) and see what that does. Feel free to give me a call if you need some moral support on this, I'm in and up for a couple of hours.

not sure about osx but if you can look in the song folder and see if one or more of the files says it's an unreasonably long length like 12 digits or more long.
