Where does one get this and the impulses to go along with it

Inquiring minds want to know

Don

I have been using SIR with sample slide.

Solod the verbs sound nice, but I am still not sold on how they fit in the mix.

I need more impulses too.

Reverbs are definitely one of my weak areas

www.noisevault.com for impulses...I've contributed a few there. They have a nice selection.

I've used convolution verbs in paris, but used pre-rendered tracks. I totally forget how I did it though.

Cheers,

Kris

I use the Gigapulse (part of GigaStudio) that can be used as a stand-alone convolution reverb with good results (could also use more impulses), but since it is on another computer creates about 60 ms of latency. I can listen and tweak the sound, but ultimately must re-record the effect onto new tracks to compensate for the delay. This is a little bit of trouble but by far the most satisfying reverb. BTW; convolution reverbs are not intended to work as bus type effects. You will not likely get the sound to sit in a space by only running a portion of the signal through the convolution.

Can you explain a bit more?

The theory behind convolution is to sample the exact acoustics of a space from a specific position. The most natural sounding adjustments are made by changing mic positions to affect the wet/dry mix. In a console style effects bus, part of the signal is routed through an all wet signal path and mixed to taste with the dry signal. To treat convolution the same would be like taking an instrument in a hall and mixing it with an instrument in a booth. The reflections will not match.

That said, an impulse from a plate reverb will probably work better on a bus, because it is much less complex (i.e., no early reflections).

I disagree, on two accounts.

- 1) There is nothing wrong with doing wet/dry blends with real/different acoustic spaces...folks with reverb chambers have been doing it for years.
- 2) A proper impulse response is just the 'wet' component of the reverb. There is no input signal present (i.e. the impulse itself is removed from the impulse response) there is only reverb/reflections. You can use the wet/dry blend to simulate how loud you make your room mics relative to your close mics.

Cheers.

With respect to RZ, this explanation of convolution is very different from my personal experience. I have been using hardware and software convolution reverbs since the Sony DRE-777 first came out... and Altiverb since it first came out (the original hardware and original software). Both were designed for, and work great in bus situations, as do all convolution verbs.

I also have GigaPulse. It is true that GigaPulse is designed to allow manipulation of mic position (and other parameters) while keeping the input/output mix fixed (as a recommended option with true acoustic spaces). In theory this will give a consistent sound stage, and I like using it that way. But:

This is certainly NOT an appropriate generalization to use when talking about convolution reverbs.

Gene

PS The 777 still sounds great and can be found on eBay very cheap. It was originally around \$15K.
