Says it's designed specifically for mics (ribbons, dynamics, Tube Mics) that need no Phantom Power, so it's got high gain, minimal circuitry, no phantom-blocking capacitors in the signal path (could be clean as heck!), designed by Fred Forssell.

<http://www.mercenary.com/aearibbonpre.html>

\$750 for 2 channels.

I've got five tube mics that might just like this thing.

Anyone? Bueller?

Neil

I played with it at AES2005 and liked it, but how can one really make critical judgements on the Javits Hall floor. I would definitely love one to drive my AEA R84 mic. Of course, then I would need to get a second mic to keep both channels of the preamp occupied!

(Un)fortunately, I do so little live miking work here these days, that I can't justify spending that kind of money for a preamp when I have perfectly wonderful GreatRiver and Cranesong preamps here.
