ess due to the amount i turned
the submix faders down)... RMS is now -14.67.

does anyone find this to be mysterious?

jeremySecret sauce?

i also noticed that when i turned down the submix faders.... the mix changes
slightly.... drums pop out more.... vocals are more out front.

sometimes thats a good.... but in my case it was a bad thing cuz i liked the
balance before.... just wanted to see what turning down the submix faders
would do.

maybe i am totally crazy!

g individual tracks at 32 bit with UAD-1 plugins. You can get the signal really hot at 32 bit and it won't clip. Then when you lightpipe them into Paris, you've still got the Paris gain structure and mix bus working for you.. It's like having a RMS turbocharger Real easy to over do it, but Paris still holds together at insanely hot levels. It really reminds me of the old days when I'd get the *warm fuzzies* sitting in the control room of one of the big studios in Austin and watching the engineer start bringing up the faders on a big analog console being fed by 2" tape tracked hot at 30IPS to keep the noise floor down in the days before Dolby SR. Sort of like cranking up a Shelby Cobra.

Howdy! I actually was able to get the CD out by repeatedly hitting the eject button immediately after powering up the Mac, as was suggested. The simplest thing to try actually worked. Amazing.

I'll definitely try that "X" thing...!

It's funny. I went 8 years with only my Atari and my 9600, and now I've bought three used os x machines within 6 months! I think it's because 1) I'm nuts, and 2) they're getting ridiculously cheap. It's insane. Or I'm insane. Or both.

ah, but the problem was that, after booting from the CD, it didn't see any of the other system folders - including the one that had worked perfectly only minutes before.

>Of course, select the OSX drive and hit the continue arrow/icon.

>That

>>should do it. (NOTE: This will not work with more than one system installed

Hmmm. It didn't seem to work when I tried it with a portable USB drive which contained my 9600 system hard drive.

I'll have to try tinkering some more.

Ah, nuts. I just remembered that I forgot to pick up my old System 9 upgrade cds. Have to try to remember them tomorrow...!

I've tested the keyboard here at home and it's fine through both into Paris.

I'm thinking there is some kind of earth problem in the rehearsal studio. Obviously an earth problem wouldn't show up through a mic, and it didn't show up on our guitarists setup which involved a laptop plugged into the PA, but laptops of course use DC and I imagine are less prone to earth issues.

Anybody got any tips here? Am I likely to damage the keyboard if I take it back? Or may it still be a keyboard fault? Next time I'm taking a multimeter to measure the earth...

Cheers,
Kim.yes it does and had to do it the other day on a friends new laptop several times while trying to get it towork.

use balanced whenever possible, make shure your cable is a nice shielded quality cable and not a 1/4" speaker cable, get an isolation transformer (<http://www.whirlwindusa.com/spcint.html#il19>).

It seems that the unbalanced cables have come too close some form of transformers in the studio. It's allways a good idea to check this if there's humming.

up a major third w/ no disagreeable artifacts. I was stunned at the ease and quality of the processing. Morgan at East Coast tells me that the new Waves Transform bundle has an even better pitch shifter. Has anyone here tried it? I've also read some amazing things about Melodyne.

Any thoughts? All three packages are expensive, but in the same ballpark.

Thanks!

GanttMan, all these people singing your praises, then this... I know I am disillusioned! ;-)
