>right click on "My Computer" select the hardware tab, click on Device manager,
open the IDE ATA/ATAPI controlers icon, right click on each IDE Channel,
click on advanced settings. Transfer mode should read "DMA if available".
if it doesn't say that, then select it, and hit OK.

>Dear Mr. Simplicity,

You have once again ventured to where mere mortals fear to tread, and inspired
me to stay up all night in the CLAY-TOR lab refining your discovery!

Check this out......Blue Mountain Jamaican coffee through a bong full of
Ivory dish soap!!!!!!

Doooooooooooooooooooood!!!!!!!!!!

The bubbles.........Oh man, the bubbles....After many trials your comments I found out that mainly
my problem to
memory crashes with Paris was the NO VIRTUAL MEMORY I had !
I thought with 1.5 GB of memory I could keep away from virtual memory
after reading all that stuff about it...
So Paris doesn't like that...
Also I rearranged my power supply and I have better 5V usage now. Don't
know but splitting all devices across all PSU cabling gave me at least

another 0.05V so I am around 4.910V which is pretty good with 5 EDS
cards and one Gigabit ethernet card.
Amplitube though still gives me crashes...
I hope this will help someone in the long run...
Regards,
DimitriosNot being a hippie dope smoker, fundamentalist or movie star I dunno

Dimitrios,
I'm glad you found your problem.

How many MB of virtual memory did you
end up setting it to? Have you removed=20
Amplitube then? I'm not sure it's giving
me problems. What version are you using?
Mine is also not wrapped.=20
