Hi All,

I just thought I'd let you know that I got one of the two hall algorithms working this morning. I forgot to implement a rather important control, but I don't expect it will be difficult to finish. I also have to make the interface layout work a bit better.

I'm not sure if this is a simple esp2 port of the DP/4 Hall algo, or if it is an updated version of it. But, it sounds incredibly smooth, full, and wide. Just listening to the outputs is awesome. It sounds beautiful all by itself. To my ears, it is an improvement over the dp/4 hall, but that may be because of its 24 bit input and output, or because all the analog circuitry is bypassed.

Anyway, it's coming soon, and it rocks!!!!

All the best,

Mike
