---=_linux42ecfa21--Well,

When I started reading Brian T's posts about how he was doing this and then talking to Dave, Mic Cross, Gene and Dimitrios about how they were integrating Paris with other systems, I sort got this concept in my head about how I wanted mine to work. It involved everything I've got here and getting it working the way it is now. I really appreciate everyone's feedback on what I'm hoping is perhaps the final piece of the digital clocking puzzle.

When I went to bed last night, things were operating normally here. I just cold booted the entire system and everything is still working normally. I thinking that I may be actually nearing the limits of this old system as far as adding devices that are sharing the same clock. Seems that every time I bring something new into the family, Paris has to go to war and claim it's *clocking turf*. This usually takes about a day of tweaking and trying different configurations until I hit the sweet spot and this one got much crazier than the others. I was getting some error messages that were really

wierd and at one point, it looked like I might actually have had 3 bad EDS cards.

Next week I'm adding a 4th UAD card to the Cubase rig, but I've mapped the Magma chassis and I know which slots in it will share IRQ with my existing UAD cards, so I'm hoping for less of a hassle since these cards don't need to interface by clock.

What's happening now is nice (knock wood). I'm absolutely loving the way the gear is all working together and the way it all sounds when mixing. There's so much crap interfacing with so much other crap that it's still sort of intimidating.....in some ways, sort of like an analog studio can tend to get, but, like learning the way around a big mixer and it's routings, it's really pretty simple (many instances of the same thing). As I get more time on it, it gets more familiar and easier.

DJ
