The DET2/2 is about \$4000.00 but can be rented.

I have never taken on a large studio design/update project without first

A studio I built in Sayreville NJ had real earth ground at + 11 volts tested at the strap point of multiple 11 foot copper ground rods!

yes-a little man came to me in a dream one night and said "Forget about it">heh.. what? I thought you were successful? payola holding you back?

There are many different levels of success-I would take somebody paying for my music to be played in a second because I know it's good. It's the people paying to get crap played that holds everybody back and doesn't give good music a chance to get played

You're other comment on the Govt--karl Rove and everybody else will be walking--no charges, no anything. These people created their own rules and don't give a shit about us that's for sure
JMinteresting.

everyone knows the music industry is bullshit, but thats the way it is. If the current channels are destroyed, new ones will pop up to take their place. I'd love to hear everyones solution to the pro

contractor in there to determine if that will solve your problem...if it's a
weeping tile/drainage issue it can be quite expensive to deal with but
better now than later when you're basement is flooding.

As for your construction needs, pop over to John L. Sayer's forum
(construction section) and ask away. Good guys with lot's of info.

-----=_NextPart_000_0087_01C592BE.6D941530--I'm just wondering if any Paris users are
session dobro
players. Any advice is appreciated.

George Axoncujo, couple things I feel the need to chime in on.

First , make sure its a licensed contractor(electrical license)

The grounding electrode systems' main purpose is to limit the voltage on
the equipment tied to it when a high voltage source(e.g. lightning,orthe
primary line on pole comes in contact with a secondary line etc.)

If lightning hits your meter enclosure or whatever everything is tied
together and stays at the same potential including you if you are grounded
at the time.

Code requires a grounding electrode to be at 25 ohms to earth . If not, a
second electrode must be installed. That is the most you can make an
electrician do for you unless you pay more\$\$.

More than two electrodes in parallel will lower the resistance to earth.

If you have city water with a metal pipe that also must be tied to the
neutral at THE SERVICE DISCONNECT ENCLOSURE.

all interior metal pipe is required to be bonded to the electrode system also .

From my experience the best electrode systems are the concrete encased type(#4 or #2 bare copper encased in the foundation floor) they always perform better , the concrete is a large contact area and is usually damp year round. not very practical for a service revamp though.

The star ground design for outlets is superior to chained . the reason being noise injected from one source is limited to that branch of the star rather than at every outlet in the daisy chain.

Use of insulated equipment grounds is better also.(gene I agree) insulated equipment grounds prevent unwanted impedance variations back to the main bonding point. make sure the equipment ground is insulated and not bare copper(like 2 wire romex)or it might split at any point it touches metal.Gotta use I.G. outlets also or the same thing will happen at a metal box.

You can do everything right and still have power quality issues. Not having the neutral earthed is a major no no. good luck.

p.s. I am a licensed electrical contractor in business for 23 years, 33 years experience .wish I could do the job , the traveling electrician :-)
