Hey my friends,

I know I have to move on and want to built a PC that can run Paris, and now I remember theres some kind of limitation on the PCI port, like it has to be lower voltage or somethin,
"the EDS cards WILL NOT fit in 3.3v PCI slots" -taken from the Paris FAQ. Do I actually have to buy an older mainboard??

Or does anybody know something good that can handle 2 EDS cards and works with Intel i7?

Im so looking forward for the new machine!

Thanks and greetings,

Micha

Here's a link to a post in a thread with an i7 system that we put together a year and a bit ago...

I attached a pdf a few posts down.

Great, thanks! You used xp 32 because the 64bit version didn´t work?

Im sure the mainboards nowadays pretty much all can handle the EDS

Hi, check this thread as well, may find some useful info. The system is running smoothly, now a hybrid Reaper/Paris box.
