get very complex and expensive. Good grounding practices not only help with clicks and buzzes, but can dramatically reduce overall system noise. In a digital studio this can make a noticeable difference.

even if you supply a technical spec sheet.

A few basic concepts:

how far from neutral tie down (closer is better).

2. Tight connections at all screw down points. Ideally this should be checked with a meter, as should the increase in voltage between ground and neutral as you get farther from the box. You should have a straight run from the box to your main power in the studio. No bouncing from outlet to outlet before the studio!

3. How clean is the power supplied from the street? Are you sharing a transformer tap with multiple homes or businesses? Sometimes an isolation transformer is needed to solve this.

4. If you have two or more phases are you maintaining reasonably balanced load across the phases, and do you have all noisy items on a separate phase?

from racks, heavy ground source cable.

Some things are obvious like triac light dimmers or florescent lights, but hig

>JMGood stuff Gene.

The only quibble I might have is about star grounding. It really

isn't needed if you do all the things you recommended below. If you have a low-resistance earth ground, then you need a true IG (isolated ground) wiring scheme for the studio power. This involves an actual green wire in the conduit and good quality 3-prong outlets instead of using the conduit for the ground. Electricians do know what an IG ground system is, and if you combine it with a low-resistance path to true earth ground, you do not need to star ground the studio.

You will need, of course, to properly balance, interface, ground reference, and isolate as required by your particular equipment.

Part of it does have to do with that. As to your comment about making the CD's look more professional than just a burned CD-R with a stick-on label, yes, you could always do that... prolly charge a little more for that sort of thing & take pre-orders with payment upfront, then mail the CD's when they come back from the dupli

you may (or may not though i would) want to pour a layer of self leveling cement first to true up the floor. 2" thickness shouldn't be a problem with a second floating floor system to spread out the weight bearing for any exceptionally heavy gear or...people. the system above is thinner than a typical 2x? system and can have wood flooring nailed to it.

as to insulating the joists and walls, remember to leave a small (1/4") gap between materials and the wall surface and use either rz1 channel or something similar for mounting the wall surface to minimize the contact (sound transmission) area.

most anything you want ca

(859) 635-5762Hehe... well I couldn't find much with the first two, except some other guy also saying he can't find any info either. ;o)

As for beer spillage, it's not so much that the key is "sticking" more that it just doesn't have any spring back, if you get the difference. As I was the one playing it at the time, I can say that no beer was spilt on the keys that night, only down my throat. It is possible that all the beer going down my throat may have encouraged, say, a "more vigourous" playing style, which may have had an impact on the sudden appearance of the fault. ;o) Though I wasn't really bashing it. I mean it's a keyboard. You should be able to "get into it" I would think.

Apparently not.)o;

Cheers,

Kim.

Now you've got me thinking. I'll bet I could figure out a way to take a lightning rod and soldering it to a TRS cable and patching it to a Paris AD routed to a channel insert.. Then from the insert output, running a TRS cable to a a grounding rod that was driven deep enough to tap the hot mineral saline water table that runs under this property from the hot springs spa across the street, then I could get myself a good quality 8 gauge copper cable, strip the ends, weld it to one of the brass eyebolts that are imbedded in the concrete in the pool that hold the little ropes with floats that section off various areas, then run that wire to one of the telephone poles across the street and then from that pole, to the telephone pole on my side of the street, then back to the lightning rod to complete the insert loop.

I'm thinking this would make a cool plugin for processing an electric guitar track, sort of earthy and liquid smooth, with an bright top end.?

;oP

Now that's thinkin'! ;o)

Right now the damaged key is middle D, so it's right in the firing line, but you would think by pulling it apart I could move it to an end key... or at very very least move it to a lesser used D.

I spoke to my friend just before and he's keen to rip it open next time I'm there, so that sound like a plan. :o)

Cheers,
Kim.:o).....nothing ventured.....etc.
