I've got a desktop pc that is a turd. Celeron 2.6Mhz, rates about 350 on Passmark Charts.

<http://www.cpubenchmark.net/>

I want to build a new pc that is about 1500 on the charts like an e6600 core 2 duo. I'd like to reuse my IDE drives and have capability to go Sata in the future and I want a silent power supply. 4GB ram. Any ideas for the cheapest way to get there?

The e6600 is about \$200 on ebay and i'm not stuck on that processor but one in that range. This box is just for writing code, database stuff and non music stuff.

Thanks,
John

Hi John,
Are you DYing the system? If so you can get a hellva allot more than a E6600.
What is the system gonna be used for? I can suggest some parts if I know what you planing with the system.

Chris

John,

I would take a pass through a couple electronics stores in your area. Last year I was planning to build, but found a decent dual core with sata drives and good video for around 450 bucks. I popped two more gb of ram into it, formatted it and installed XP pro which I already had a license for. Total cost was around 550 for a damn fast machine.

ps - in my local office depot there was an open box quad core HP with 3 GB of ram, 512 dedicated video, tv tuner, HDMI output, 500 GB sata, 120 GB porta drive - for 650 bucks last week.

thanks guys, i went and bought one. got parts from my local guy and got a MS-7357 motherboard G33M, e6750 cpu w/ 2gb dual channel ram, antec power, 80gb sata, case and dvd burner for \$875.

I went to circuit city to look at the hp and the sales people were so lame a i walked out. The hp would do dual monitor so that was no good for me. I'm just doing coding, database stuff and some games so this box sound do well. I'm doing my 89 windows updates as we speak so it's up and running.

Thanks !
John

I was looking at the ADK website while ago and for a little over = \$1500.00 I could get a quad core screamer with the OS already installed = and tweaked. All I'd need to do would be to add a couple of the 500G = SATA drives I've got here as backups and I'd be set.

Yeah, I could build it cheaper, but not much and when I figure in all = the time it takes to build it, load the OS, mobo drivers, optimize it = and burn it in, paying them the extra \$\$ for their time and expertise = makes sense in my situation.

I'm really thinking seriously about this. I'd like to be able to track = at 64k with the Cubase control room. I've been using it at 128k and it's = tolerable, but the difference between 64k and 128k is noticeable to my = ears. 64k is equivalent to what I hear using Totalmix, and the more I = get into Totalmix, the more sense it makes. It's also much easier to = deal with when you're only using one audio interface for all your = tracking/playback. I'll have that situation sussed in about a week.

I assume thats pre-built not just parts? If it's just part then that is really high priced for that stuff.

The list of stuff you have here is about \$500-\$600 worth of parts.

> I went to circuit city to look at the hp and the sales people were so lame

If you are using the on board video don't expect much to happen when it comes to games.

HI DJ,

You can configure a system w/ tower, power supply, Q6600, 2 gigs ram
160 gig OS, 320g audio drive, Geforce 8600GT dual head video (fan less),
DVD burner, XP Pro, 1 yr warranty, life time tech support for \$1437.00.

We will putting out a sub \$1000 in a week or so sense we Americans is so poor. :)

Our overseas sales have went thought the roof lately. :) We don't cover any shipping with our warranty for overseas systems just life time phone/email support. But even with them paying the shippings with a warranty issue of some sort it is still less money that buying it in their country. jeez.

The overseas sales that always make me laugh are the ones we get from Taiwan, Hong Kong and India.

I'm thinking of spending a little bit more and getting the RAID 0 setup.
This box will likely be doing a bit of video editing as well.

I'll probably get a PCIe card for one of my Magma's and either try that with my Magma holding the RME cards and interface the other Magma with the UAD-1 cards in one of the PCI slots, or I'll just yank the MAD1 and AES32 out of the Magma, load them in the 2 x PCI slots on the MOBO and then try interfacing the other Magma with the DSP processors in one of the PCIe slots. You got a mobo that you think would handle this? Are you guys OC'ing these quads to 3GHZ?
