We are having all kinds of problems getting Paris 3.0 to work with XP Pro. Originally we started using a Abit An8 with an nForce 4 chipset, AMD Athlon 64 X2 3800+, 2 GB ram, several hard drives and XP Pro. We use 1 Mec and 2 EDS 1000 cards, also a Matrox P650 dualhead pci-e video card. We followed the installations tips for XP beta drivers, but no luck. Thinking maybe Paris didn't like the new chipset, we switched m/b to a Asus A8V-E with a Via chipset, still no go. Why is it, some people seem to get it working with no troubles, and others can't seem to ever get it working? Also, what should be seen in XP's device manager? The only things we see are a Ensoniq MIDI driver. Is this indicative of a conflict? The error message we get is Error 1/1: Can't initialize engine. They work just fine on the older pc with Windows 98se. Unlike in 98se, XP doesn't show any Ensoniq EDS1000 cards in Device Manager, only the Paris Midi Driver. It doesn't even recognize that a new device is installed, once the EDS cards are put in. Other cards such as mdoem, network card, etc. are recognized. Need help.

Did you install the FX Subsystem?

Yes. When putting the EDS cards, it doesn't seem like XP is even seeing them, as with other devices. I am hearing more about Matrox video cards not being friendly with Paris, which is a shame because they are nice cards. Is anybody running Paris with any of the new motherboard chipsets? How about dual core cpu's?

There are certainly known issues with dual core CPU's, though my understanding was that the app would load, but crash, and that the issues mostly related to the C16. They are a known issue however, but there was recent talk of a workaround, involving a line in Windows which changed the way the second core responded to interrupts or some such thing.

Cheers,
Kim.

Sorry to hear about your trouble!

I installed a one-card w/MEC + 3.0 on XP Pro a couple of weeks ago. The MB is an ECS (garden variety cheapo on sale at Fry's) with a 2.66GHz P4 (non-Hyperthreading CPU) and a gig of Corsair memory.

First, verify that Hyperthreading is disabled in your BIOS (if you're using a CPU that supports it).

I had to install the drivers a couple of times as the EDS did not show up in Device Manager. Remove all PARIS drivers, shut down, remove the EDS, then restart. Follow the instructions for PARIS XP installation exactly. After you reinstall the EDS, XP should find new hardware and install the EDS driver. If this doesn't happen, it is likely that you have a hardware conflict.

Another thing to try is to move the EDS to a different PCI slot as an IRQ conflict may be the issue. If that doesn't work and XP still doesn't detect the EDS, I would swap out the Matrox card for another card (mine's an ATI 9250 8x AGP) to see if that's the source of the problem.

After reading about DeeJ's troubles with Matrox I didn't even consider their products for this machine.

Hope this helps!

Mark
