Hey all... I am so confused and not sure what else I can do... For many years I used my Paris without the C16. I like using the mouse. So the C16 sat in the closet for many years. Now I really need to use it. I plugged in a CAT5 cable on the EDS card and out to the C16. When I power up the computer I see the C16 flash, like it is getting power. Then I start up my Paris and nothing happens on the C16. I have a check mark in the EDS - A card in the settings, but I am not sure what else to do to get it operating. Can someone please help because I am in desperate need of this now... TIA
~ Ed

It is a regular CAT5 cable and not a yellow crossover cable....right??? If it's a yellow crossover cable, you've probably fried it, and your EDS card.

Nope... it is a regular CAT5. The EDS works fine and like I said.. when I power on my computer I see the C16 flash like it is getting power... but when I start up Paris, it doesn't work... Like something is turned off... but I am not sure what or where... Any other suggestions?

Check to see if the cable is properly seated in the input of the C-16. If it's not properly locking in, this can happen.

It's strange... Perhaps the C16 went kapooie... But it is also strange that I get a flash of lights when I power up the computer... but nothing after that..

Just as a longshot, on the rig I have at the office, the second EDS card I have in the computer is the "A" card. That's the one I have the C16 plugged into.

How many EDS cards do you have? If you have more than one, have you tried plugging the C-16 into a different card?

Do any of the channel LEDs light up if you press and hold the "SubMix" button on the C-16?

Check the Jack on the eds and the C16 - I have had those individual prongs inside bend were they did not make good contact and the C16 would flicker.

If your carful you can re alignn them....not sure if this is your issue or not...
