Anyone familiar with Layla products? I'm not sure what's going on here, but my Layla 24 won't link up and transmit audio to my Masterlink. This box is running only Gigasampler on XP with one Layla 24 and the console and it works fine otherwise. It says in the manual that no Echo hardware transmits the SCMS bit. I assume this is the Serial Copy Management System built into Minidisks and DATs. This shouldn't have anything to do with it.

In the Layla 24 Console the digital out meters do not light up. I can't seem to get the digital out to work at all. I've looked over the manual but can't figure out why it won't transmit digital audio.

I'm using a coaxial cable with unknown ohms which has worked in other S/PDIF apps before with no problem, but in the manual it recommends using a 75 ohm RG59 video cable? I never had a problem before sending data out of Paris into the Masterlink. The analog outputs work fine. Is there possibly a setting in the Layla console which I'm not aware of? If there is I can't find it. Anyone got a clue what's going on here?

Appreciated,
Rich
