I just installed a new MoBo as per recommendations here an G K8NS. I have moved my PARIS card to and from many different Comps and never had a problem. Not so now. When I go to start the splash screen comes up followed immediately by cannot iniatialize error code 1/1.In checking my card it seems to not be completely seated but it is as for as it can go. Might I have to shim the MoBo a little.It's not very much, maybe 1/16 of and inch. What else could it be. Thanks Jim

The Gigabyte GA-K8NS mobo will require a fresh install of Windows. The NForce3 chipset will not play nice with the driver set that has been loaded on to your OS drive when used with a different mobo.

Hi Neil,

Yes good point.

If its on slots 1-3 it could be resting on the chipset heat sink fan and on slot 5 it could be resting on the yellow USB port connectors.

Or, could it be the very back end of the card, hitting against a lip or ridge or something like that on the inside of the case itself (depending on how deep the case is)?

Hi Guys Thanks for your responses. What had happened is the new MoBo came with it's own risers. I replaced my old ones with them and the new ones were a tad shorter, so the metal tang was preventing the EDS from going down far enough. I am putting the old risers back in but wouldn't you know I'm 2 short. Well not me but the number of risers I have, so I have to wait to finish until I can get to town and get 2 more risers. When I get this I will be back with more?'s. Thanks again Jim

You don't want to just get a crazy straw & cut a couple pieces
to length & stick a couple screws through there? lol

Neil

I thought about that but I didn't have any screws the right length. ;^)
