1.
Is disabling the USB really necessary for a new Paris rig?

  http://www.kerrygalloway.com/WikiPARIS/wikka.php?wakka=WinXp

overall the setup / extra tweaks doens't seem like too much.

But with a new rig I'd probably be using usb for mouse keyboard... do u guys use usb
mouse/keyboard??

2.
also concerning smpte for paris.
I have an atari running notator with log3 and unitor 2 which can output smpte.

I plan on just striping a track in Paris with smpte, and sending the output of that track to the unitor
2's smpte in and having the atari follow that smpte track.

From what I understand I don't need the SMPTE module at all. Or am I missing something?

3.
third question. If i want to route audio out of a Paris i.e something thats been recorded and run it
through some outboard. Do I encounter he same audio delay compensation problems. How
difficult is this to re-allign. I don't have outboard at the moment, but I've heard of ppl complaining
about the lack of ADC support in cubase logic etc. Does this similar problem exist in Paris.

i checked out that article which seems to relate to what i'm talking about..

but i'm a relative newb so i'm not 100% sure it covers what i'm asking
