Paris will not run on the latest Mac OS or the latest mac hardware.

Okay, i want to stick with PARIS. but my ancient beige G3  
just won't recognize my extra internal hard drive anymore and  
my external cd burner is very erratic.  
there is only a SCSI port on the mac.  
could i buy a new mac and find drivers to run paris 2.1?  
i assume if i could, i would have access to firewire and some way  
to recover my audio files to the latest mac OS.  
thanks guys

1.25 G4 single processor (not the dual) is the latest mac that will boot into  
System 9.....got mine on ebay

Correction, Paris will run on G4 duals, including the 1.25GHz dual. However, the dual machines are a waste of money because Paris will not utilize the second processor, also they run hotter and louder! Paris and OS 9 will not run on the G4 FireWire 800 machine, the vary last G4 tower made.

You can pick up a G4 400 to 500 MHz machine for under \$100.00, check ebay or Craig's list. Paris will run fine on one of these machines. If you want to run a bunch of plugins these machines can be upgraded with faster G4 processors. OWC is one source for up grades.

You can also run Mac OSX on these machines on separate partitions or separate drives. OSX will run better with a faster processor, and you can add a pioneer DVD burner and utilize Apple's video and DVD authoring software. The other advantage to having a dual boot Mac is, you can run the latest greatest software like Logic, DP, LIVE, Cubase, PT, etc. So for instance, if you wanted to use mastering software, you could reboot in to OSX and open your Paris song with mastering software in OSX.

Hope this helps!

James

One other thing! If you go with a G4 400 MHz+ make sure you get the AGP version, not the PCI version.

If you're running plugins along with PARIS on OS9, the plugins should be able to grab CPU cycles from a second processor, right?

And when running OSX for other applications, having a second processor is very useful, almost double the processing power.

Cheers,

This is true, however money might be better spent on a new machine than a dual G4. With G4 400 and 500 MHz under \$100.00 it's hard to beat if you want to keep rolling with Paris on a Mac. I'm looking at plugins that cost more.

thanks for the help!

let's see if i got it straight--  
i should get a G4 400 to 500 MHZ,  
AGP not PCI-- (i don't really understand this part)  
pull out my PARIS card from my G3 and drop it into the G4,  
and load my current operating system and go with that.

Will I need new drivers to run PARIS on the G4?

what's the best way then to add a CD burner to my new gear?  
Any suggestions as to the model of the new burner?  
Because the G3 had only a SCSI output, i've had trouble  
finding a reliable CD burner. I've tried several and had  
my old Yamaha reburbished and none have been reliable.

is there a way to retrieve my data from the internal Maxtor drive that my present machine no longer recognizes? This has been a baffling problem for me-- why the Maxtor has gradually failed to show up and now finally is invisible to the G3.

will I be able to add either an internal or external additional hard drive(say the Maxtor, which I don't believe is at fault)?

thanks again-- i appreciate all the suggestions and patience with my ignorance about what is obvious to a lot of you.

jp

Hey JP! You can try to add the Mixture, but it might be shot. If not it should work. You can also add hard drives up to 127 Gigabits. You can install larger HDs but it will only see 127 GB.

You can do a search to find CD burners that will run on OS9. There are companies on the net that have older Mac parts. You can also add a Pioneer CD/DVD burner. I don't know for sure if the newer models will work with OS9, but that shouldn't be too hard to find out.

You will not need any new drivers to run Paris on a G4. Just make sure you get the original installer disc with the machine you buy. The transition should be easy and it would be the cheap way to keep Paris going. Keep in mind, you can get any Apple G4 tower to run Paris except the last G4 FireWire 800 model. My suggestion for the 400/500 MHz model is because they are so cheap. You can get a much faster model if you want. Faster is always better.

The AGP is for the video card only. The earlier model 400/500MHz are PCI only and I think have slower bussing or something. Most 400/500 MHz machines you will find are going to be AGP, but you should make sure. It's also a bit easier to find AGP video cards if you ever have to replace it. You can go look at all the specs for all models at [www.apple-history.com](http://www.apple-history.com), go to the left hand column.

When the time comes, shoot me an email and I can help you over the phone with installing drives and such.

James--  
thanks-- once again for helping me --  
you've done it before a while back--  
and i'll be grateful for your help  
again when i get my next mac  
cheers,  
jp

I might've missed it... but did you try to replace the ribbon cable to your hard drive before you go to all this trouble over it losing the maxtor?

>what's the best way then to add a CD burner to my new gear?

Use a Firewire CD writer.

Here's one

<http://www.glyphtech.com/site/products/optical.html>

Here's some other options. Do check on OS compatibility, but they probably have one that will work.

<http://www.firewiredirect.com/categories/05/>

>will I be able to add either an internal or external additional  
>hard drive(say the Maxtor, which I don't believe is at fault)?

Get a Seagate. You can add a modern drive with a host card from Sonnett.

<http://www.sonnettech.com>

You will lose a card slot of course.

Ask them to recommend the right card for you. They may even have an SATA host card and if they do, go for it and get a new boot drive as well as a new media drive. You won't believe the speed increase.

You should develop an OS9 dedicated extension list, and ideally just use this computer for PARIS and do all your regular computing on something else.

Several of us have developed OS9 extensions. Mine are on this site:

<http://www.parisfaqs.com/>

good luck

DC

Hi AA--

actually i tried switching the boot drive to the maxtor's position and vice versa. G3 still wouldn't recognize the maxtor but had no trouble starting otherwise. of course, the maxtor itself could be the culprit.

jp

One more thing. Be aware that the firewire buss on blue and white  
G3's did not like more than one thing plugged into it...

Dumb huh?

I don't know when they fixed that, and it may apply to G4's as  
well.

A FW hub solves it.

Oh, also, B&W G3's will not run a current mac KB and Mouse!  
They only run the original leetle KB and the silly round mouse  
that came with them.

Use a USB hub and the current KB's and mice work fine.

oh, great--  
now a lot more considerations

:-)

i'm at my wits end(not a far walk)  
and can't figure out how to proceed

my G3 doesn't respond to the maxtor,  
my lacie cd writer only gets it right 20% of the time,  
my audio files are unavailable thanks to the maxor  
and my latest CD release is totally fubar

help!

(thanks-- sincerely-- James McCloskey)

Did you try disk first aid? If not, try to run Disk First Aid from the OS 9 installer CD.

Hey again James--  
yeah, i did all that and  
ran Disk Warrior, all the stuff--

i figure i'm totally fubarred at this point--  
got to get real, buy a new system, forget my old audio files  
and start over.

but thank YOU particularly for the help  
jp

Was the Maxtor a boot able drive? If so, see if you can go under "Start up disk" and see if it's in there? Is the drive making any noise like spin up and spin down. The head arm might be stuck. You might want to try tapping on the side of the drive lightly. Beware you could damage the drive doing this how ever, what do you have to lose. I'd have a drive ready to transfer files to.

The drive might be shot. Here are a few suggestions:

Call Apple, they have ways of retrieving data. I had a HD head crash and the drive died. They told me they could transfer my data to the new drive they were replacing on my ibook.

Disk Savers, this would cost some money though.

Last you could send the drive to me and I will see if I can get your data back, when I have spare time to work on it.

What ever you decide to do, good luck!

I'll catch you tomorrow.

This is gonna sound nuts, but have you put the maxtor in the freezer yet? If you're not up on this lofi tech solution, holler back and I'll explain it more.

I was going to suggest that one!!!! Had it work on multiple  
"unreadable" drives before. But once again, make sure you have one to  
move everything to handy.

James, one more time--

okay

system profiler finds:

"internal ATA 1 ID=O Hard Drive no volumes mounted"

this is the maxtor, but don't know where to go from here.

also, profiler says the unformatted size is 27.54 gig, though the maxtor  
is 40???

oh, and no--  
the maxtor doesn't show up under "start up disks"--  
it's curious that no driver is listed in the system profiler for the maxtor,  
though it's worked for a number of years and only recently started to flake  
out--  
i'm thinking of going with the freezer suggestions next, though have no idea  
what this means, how cold to get it, when to take it out,  
or what the condensation factor will have....  
or, for that matter, how to cook it later and whether a marinade is appropriate  
or a simple  
searing in a hot pan with a little olive oil...  
the whole thing is getting pretty funny in a sorta frustrating way  
thanks again again  
jp

Hey Gantt,

We lost touch after the last phone call. Hope all is OK. Dean is doing better.

Give me a call when you get that time

Phil Badell

I usually roll 'em in a plastic bag with silica gel to keep the moisture down for about a half hour. Keep it away from 'wet' items like the ice tray or ice cream cardboard containers, anything that has frost on it if possible. Best if you have access to use a frost free fridge. When you pull the drive out, have everything else ready to plug, boot and roll because your time will be limited if it does help. Sometimes this works, sometimes not.

Rinse/repeat until the drive finishes off or you get all the data you're after. Toss the drive afterward in the trash heap if this does work because it's a goner for useful data storage.

jp

I usually stick them in my freezer for about an hour (no joke!!!!).  
Pull it out and immediate reconnet...Start copying the most important  
files first. Had a couple that I didn't make through the whole drive  
beofre it died...then it realy died.

What is funny, is that you "freeze"drives to get the data from it, but you  
"bake" audio tapes to get the data from them.....  
Who woulda thought??

---

the technical answer to this is a little beyond me--  
i seem to remember an enginner, while describing  
thie bake (no shake) technique, saying that it had to do  
with removing any accumulated humidity and getting  
those little particles to stand up straight.

a "real" engineer could give you the straight dope on  
this. i am sure that you can only bake your tape once,  
and you'd better have a way to store the data immediately-- curiously again,  
just like freeze drying a hard disc.

---

i've been given the green light for updating my whole system--

i'm thinking a g4 with OS9(one thing, not the dual--  
god, i'm so inept)

i have the two hard discs--  
including the one that came with my g3 as well as the maxtor  
that doesn't show up on my g3 anymore--  
i need a way to recover the data on both discs--

i also need a reliable cd writer--

i have a LITTLE bit of money to do this  
(i'm an artist with no defenses)

any help?

you people are the greatest!  
jp

I have an extra Memorex USB/FW external CD/DVD drive that I  
don't need. I would think that would work with a Mac no prob.  
Offers?

Neil

hey neil  
it would be worth a HUGE amount to me  
if i had any money--  
thanks for your response

i need someone to tell me how to do it

jp
