Well.since the *theoretical* limit for Pulsar cards is x3.....at
some point, someone needs to get 4 of them working in one Magma chassis with
4 x uad-1's in the *other* Magma chassis on the same DAW.

Also, if Chuck happens to be working on a new ASIO goodie for us, since my 4
PCI slots in the Paris rig that don't share with the AGP are occupied by EDS
cards. I'm going to need to put my Paris cards in a Magma with the UAD-1
cards. There's going to be a bit more IRQ flexibility on the Paris DAW
because the EDS cards can share IRQ with the UAD-1 cards, IIRC.

;o)

Deej

That means in about, say... a month or two... you'll be looking for a 4th Magma.

Well, I can tellya this much: I'm muthafucking pissed already - apparently

they don't use one copy protection key code, they use one copy protection key code for each MUTHAFUCKING INDIVIDUAL SUBAPPLICATION/EFX PACKAGE! Goddammit...

there are twenty-fucking-six of them in this package, and I can either enter them all manually, or wait til I can download the individualized file for this card once I can log onto their website registration section & use that file (which supposedly takes care of this in in fell swoop). Problem is, it's been like 30 minutes since I sent the e-mail requesting authorization & still nothing... so I assume that it is NOT an automated system, so do I now need to stop everything & wait til those bastards wake up over there in Europe?

The secondary problem is, the names on the reg key section (if I want to manually enter them) don't match the names on the key number info I was provided. For example: the installation software says: "Effects Package", and "Effects Extension", but the key info I have says "Effects Package I" & "Effects Package II"... do I assume that Effects Package II is the same as Effects Package Extension, or if it's something I don't even have, and I'll fuck up the installation if I try that to see if it works?

For Fourteen-Hundred-Mutha-Fuckin Dollars, you would think you'd get better support & clearer documentation than this.

FUCK!!!!

Deej, what'd you do when you installed yours?

IME, a \$1,400 PCI card had better not only sound kick-ass, but damn near clean my house, do my laundry & give me a blowjob as well... but at the very least, it should provide a flawless & smooth installation process.

Over an hour now & still no word from the Krauts. What time is it over there? Is it morning yet? Or are they perhaps on one of their government-mandated 30-day vacations?

Did Ali send you an allkey file? You should have received one by e-mail. All
you do is jut point your install query to this file and it loads everything
at once in one simple step.

Further observations:

Without a doubt, THE SINGULAR most counter-intuitive application of any variety that I have ever come across... I now have it installed, but still not "working" - in the sense that I can't figure out how to internally route anything to anything. The manual is no help whatsoever in this regard.

More to come, I'm sure.

This will provide little solace at this point, but 'counter-intuitive' at first blush often becomes 'very powerful' at later date. This isn't a particularly 'Paris-like' attitude, as it was designed from the ground up to have a gentle learning curve to anyone familiar with a mixing desk and tape.

It's a little like Notepad vs. Emacs. Anyone who has ever used a typewriter can create and print a grocery list with Notepad. But that's pretty much all it's good for. It won't let you insert a chart, change much in the way of colors, auto-indent lists, do any real print formatting, and it certainly won't automatically color code xml, run perl scripts in a shell, keep track of how many curly braces you have open, or replace every 'MakeRegexLater' with '/^[0-9][a-Z]{5,36}.\$/'

This might seem pointless, and I can hear you screaming that you just want to make a grocery list, but I distinctly remember thinking the SCOPE environment qualified to be described as 'tricky to learn but easy to use once it's learned' instead of just 'hard to use.' Also, it was designed by Germans.

So give it a little time, and be glad you don't have to learn Emacs,

TCB

My current car is a BMW, my last one was a Mercedes... I just want to drive them well, I don't want to learn how to build them.

Likewise, I don't want to feel like I have to become a fargin'

computer programmer just to use this bitch.

It's got until the weekend to:

1.) Get me a fucking authorization code that will let me log in & download the key code file (i'm pretty sure I'm missing some modules, because I was having to guess at what some of the subapplications were, since the nomenclature is different from the documentation to the software).

2.) Reinstall fully & correctly once I have that & be able to route between SX & Pulsar without a hitch.

3.) Work flawlessly & glitchlessly with my RME cards active at the same time for tracking needs... this was GOING to be an option that I was willing to find a workaround for, but since it's now pissed me off from the get-go, it's an option no longer... it's a mandate.

If it doesn't do all this by that time, it's going back. I have no fucking sense of humor for expensive esoteric shit that doesn't make my life easier & allow me to be more musically productive. If I wanted to be Rube Fucking Goldberg about this shit, I may as well start building my own discrete console from scratch.

Had it.

You're right, I don't... BTW, it's now about twelve hours from
when I first sent the e-mails requesting the login info....
and...

....you guessed it, still no response.

BTW, Thad, another example of German-engineered product that
doesn't take a degree in quantum physics to operate is
CubaseSX... everyone said that had a steep learning curve, but
I didn't have any problems getting that app configured &
operating it fro the get-go. This thing is like some
bizzarre "M.-Night-Shamalyan-meets-the-DaVinci-Code" version of
a music application.

Neil,

Call Ali Fawaz:
Creamware Audio USA & Canada
Office: 604-435-0540
support: 604-435-5158

He will get your allkey code situation straightened out and can answer your questions.

Once that's received, call me and I'll walk you through the install and get you up and running with the mixer. Also, probably the best source for info is the guy you bought this card from. He's all over this system and can tell you everything...and*will* tell you everything. My install went well, but I had the allkey file. Give Gary a call. He's Creamware's *unofficial* US tech support. Ali is the *official* tech support. Both of them helped me out and were glad to do it. Gary is a recording engineer, knows this system inside, out and backwards and is very good at explaining it. especially to someone who wants to use it *normally*, but to his credit, he even understood what I was wanting to do with the Paris interfacing. He knows his stuff.

Deej

Neil,

Think of the Scope routing window as being very much like the Paris virtual patchbay but with the ability to configure it to talk to different drivers and to configure itself to different mixers.

In order for Cubase to interface with the Scope system, the ASIO configuration you want Cubase to *see* needs to be set up first. that's why Scope launches automatically at Windows startup.to load these drivers so that when you laujnch cubase SX, your ASIO drivers are available. Scope "is" launching when you boot your computer....right?

Thad,

He's as frustrated with the Scope situation as I was the first time I saw RME's Totalmix. To my thinking, the Totalmix should be called "Totalcrap"....but Neil probably understands it completely and it made perfect sense to him the minute he saw it.....sorta like the Scope outing window did to me (sigh). I can relate to his frustration in that regard. Sometimes I don't want to even get into anything new because I've been up and down so many learning curves that I feel too burned out. The "jack of all trades, master of none" thing starts to rear its ugly head late at night when you're sitting in the control room trying to figure out some niggling thing that is holding you up from what you want to accomplish, then you need to get the manual out for some other thing to get this to happen and suddenly you are looking at a stack of user's guides and manuals three feet high and realizing how little you know, or how much you've forgotten about each one. Thank goodness for newsgroups like this.

I hope you have a good holiday wherein tomorrow we shall slaughter millions of fowl who have been so severely inbred that they can no longer function as viable living things in a natural environment whilst we watch football and gluttonously celebrate the usury of our native bretheren and the abuse of their land, culture, spirituality and hospitality.

Thad, don't take my comments as though I don't appreciate your words of encouragement, I'm just fed up with things like:

a.) Overzealous copy protection (a separate code for each of 26 applets? C'MON!!!!).

b.) Installation software that doesn't install things correctly

c.) User interfaces that are so confusing as to cause my synapses to short-circuit...

....and this thing has all three of those.

Deej, BTW, I did call that support #, and the guy a I talked to (I assume it was Ali... he "sounded like an Ali" - if I can say that without being accused of accent-profiling), and he said that the reason I hadn't gotten a reply yet is that Creamware has a big Christmas special going on & that their mailboxes were full (yet another fortuitous sign - a company that's not prepared to handle a large volume of support services... what's going to happen when all those users who're buying all the stuff they're moving out the door right now need THEIR keyfiles or other suport?), but he said he'd try to see if he could get the keyfile for my card & e-mail it to me.

Will keep you posted.... the carnage continues.

Yes, I noticed that aspect of it right away, but as I mentioned,
I don't think all the modules got installed, because I can't
even find some of them in order to "virtually patch" them.

>In order for Cubase to interface with the Scope system, the >ASIO configuration

NOPE! That's another thing that seems to not have gone right
with the install... I can manually launch it now that I
physically moved certain files from the "app/bin" folder from
the CD/DVD drive to the same folder on the HD, but something's
still not right... SX certainly doesn't see any of the Pulsar
plugins or I/o's (if I'm supposed to be able to see the ASIO
i/o's from within SX - dunno about that one), and Pulsar doesn't
appear to see any of the SX ASIO i/o's. I can see the plugin
dll's & whatnot if I open up the appropriate folders on the HD,
so I have no clue why they wouldn't be showing up in SX (ok just
ONE of them is... some "XLT Recorder" thing - which makes it
even more strange - why one & none of the others?

Neil,

Uninstall Scope using the uninstall utility in the windows Program menu.
Then go shopping, do some other things and wait for your *allkey* file. when
that arrives, give me a call and I'll boot my machine and walk you through
the install. It's a little confusing, but not bad. ..but the *allkey* file
is necessary to kep from losing your mind completely.

I left you amessage at the house about an hour ago.

Well Neil, as you informed us your current car is a beamer and your last car a Mercedes so you must have the knotroll to hire someone in the lowly profession of computer programming to help you out. Or not, of course. But if interface simplicity is the primary concern Creamware gear might not be the best for you.

I would probably do this, but the likelihoiod of finding one of
them around here who knows what "ASIO" means is unlikely indeed,
but what I was really inferring is that not ALL German-
engineered products are as your implication suggested.

Otherwise, the Braun Oral-B toothbrush would likely require
seventeen passcodes & a support newsgroup/hotline, as well.

IOW, I certainly didn't have to become a BMW or Mercedes
technician just to be able to operate either one.
(Although I still haven't been able to get my dashboard clock to
stop blinking "12:00" lol)

:D

Did the message say: "Put down the razor blades... it's not
really all that bad!"

:D
