Has anyone ever run 8 eds cards successfully for an extended period of time?

What motherboard, setup?

---

BT had an 8 card set-up in the studio in Nashville for quite a while.

He used a single 13 slot magma to house the cards.

David.

Since the Magma has one card actually in the PC are all the EDS cards sharing  
1 IRQ ?

No, the computer sees the 13 slot Magma as two seperate PCI Bus'. In  
our 5 card set-up (13 slot Magma) I have 3 different IRQ's for the EDS

---

cards. 3 cards are on 1 IRQ, 1 is sharing with the network and 1 is sharing with USB (if I remember correctly). Never had a single problem once I got the bad ram replaced on the machine (WinXP).
