hi
i'm trying to install the eds1000 card onto my xp pro sp3 laptop. the card is in a 3 slot magma chassis, which connects to the computer via the pcmcia card buss slot. i keep getting an error message saying the class installer is denying my attempts to install or upgrade the card. the card is showing up in device manager simply as a "multimedia audio controller", not as a "scherzo" device, as it should. the magma drivers are properly installed, and magma is operating properly. have tried the card in all available slots inside the magma, with the same results. i've tried other types of pci cards inside the magma, and they all work perfectly- so it's definitely not the magma--- for some reason, the class installer won't let me install the scherzo driver for the eds card--- never had this problem before, installing to a win98se os laptop. anyone know what's going on, and can help me out?
thanks so much---
harry

Are you using mikes drivers? If not to go from 98 to xp I would recommend getting Mikes drivers, and you can bump up to version 3.0 for fifty bucks. Very solid and dependable. I have no issues on my system with mikes drivers. Not to say I have not had any problems but they came from me messing around. When you get the drivers you can always just reload the program. This is just my opinion and believe me I am not a C++ type of guy I can only speak from my experience. Good luck, still hard to beat the Paris sound !Rich
