---

My formerly trusty AKG K240DF headset no longer gives me a left channel.  
The jack wiring seems OK, so the problem is somewhere in the headset itself.

Does anyone have any recommendations for:

A) A good place to fix it?

B) A good reference headset at around the same price?

The K240S is the current AKG model at \$99. Lower impedance at 55 instead of 600 ohms. Any opinions on those?

Cheers,  
-Jamie

I don't know who works on these but without my older (600 ohm) K240DF's I would die.....plus....you can kill Behringer headphone amps with these too.

I hear you DeeJ, I'm half dead now. My left side has gone numb. Or is it my right side?

Plus, I have a Powerplay Pro-XL that I haven't been able to kill, and now it may never die...

I guess I'll just get the K240S and see if the numbness goes away, but the headset amp is probably safe now.

Cheers,  
-Jamie

Chances are the headband (AKG part number #2040M0209) has broken inside the earcup, and the wire has come off. To check this, use a heat gun to WARM the aluminum cap on the side of the housing (taking care not to melt the plastic). Once warmed, gently pry up the cap (the heat will soften the glue). Remove the phillips screw under the cap to remove the cover and expose the wiring. You can simply solder the wire back on, but if the headband is broken, it should be replaced.

David.

You can't go wrong with the K240S. I use it all the time as well in the studio  
as  
at home. Great value for the money.

Greetings  
Ab

Thanks Ab, good to hear!

I'll probably get the 240S and also try and fix the old headset using David's instructions.

Cheers,  
-Jamie

Hey Jamie! Did you check the continuity between the plug and the driver?  
It could be the cable, or a bad connection at the driver.

James
