.....sooooo.....your mix is slammin' Cubase and it's completely out of headroom. The Paris submix clip lights are lit up like a Christ mas tree when the singer pipes up and says....."man, that sounds great, but I need more level on the vocal". The engineer (being me) just grins and pushes up the fader on the Paris track. It doesn't clip.....it should, but it doesn't.

;oD

Well.....yeah, except for the clients who like bursts of noise in their mixes. Clipping the kick and snare can really get a nice grungy rythmic vibe going, and if properly focused through a tube out the window, and skyward, I can actually disturb the electronics in passing aircraft.

Channels in SX shouldn't clip either.

It's only bluegrass in these parts if you are using the same tube to try to bring down aircraft with bursts of noise and as a means of shotgunning a huge reefer when not in anti-aircraft mode. It's hard to believe that people who are so loaded on ganja can move their fingers so fast.

Then there's something wrong with every cubase sx setup I have ever used.
If I make the clip light come on any individual channel by raising the fader too high, I get nasty digital distortion every time.

I believe that's not the actual channel, but the summing bus clipping. The channels are 32 bit floating point, hence effectively unclippable. The summing bus isn't, hence if you feed a channel with the clip light on into the summing bus, the summing bus clips at the input stage. Hence on normal Cubase systems, whenever a channel clips you hear clipping, but it's not the channel itself that clips. It's the moment the channel outputs to the summing bus.

What I don't understand is why doesn't DeeJ get the same clipping happening when the floating point Cubase channels output to the ADAT? Seems to me that the linear ADATs should suffer from the same issue as the Cubase summing bus.

Cheers,
Kim.

Is this the summing bus equivalent of if a tree falls in the forest does it make a sound?

Well that depends, is it a 32 bit floating point forest? ;o)

Cheers,
Kim.

hehehe...guess i better return to greener pastures cuz me be slow. on
an other note my wife, myself and friends have decided it's time to
bring back the phrase "blow me". it's been totally under utilized for
far too long.

I can definitely clip the track if I'm looping it through an insert to/from
an external processor, so I would say you are correct sir.

Yes, "in principle" 32-bit float shouldn't clip, but SOMETHING's clipping in there... maybe what Chuck and I are hearing is the convertors clipping at the output stage? Dunno. I can't say as I'm hearing the summing buss clipping on input, otherwise once you started feeding a handful of channels to it, it would clip all the time, right?

I dunno, I seem to be able to get SX to clip, even when I've got a brickwall limiter strapped across the 2-buss... you still have to kind of watch it, as it were, because even under those circumstances, if you push it too hard, you can hear it get a bit murky/unclear/distorted - I'm not talking about those harsh "digital overs" like snaps & dropouts, but it's something that's not very pretty... not a good type of distortion.

You just have to be careful, is all - it's not a big deal, the easiest way to deal with it that I've found is each time after you add/record a track, simply bring that channel down to -6 db & that way you've got some headroom everywhere to raise a few things up if needed, and obviously, plenty of room to go down, as well.

Deej is taking individual channels & groups out of SX & into Paris via lightpipe, so maybe that's part of the difference.

Not having probs with clipping here at all, unless its at the stereo buss
level going to converters.
