Ok, finally got a second EDS card installed properly and working. After about 1 minute of working with it, I started getting a permanent crackle in one of the two card submixes. Even whilst playback was stopped. The crackle shows the submix faders. Any ideas?

I've tried reinstalling the driver (both using setup and device manager - the latter doesn't work at all, although having searched the newsgroup this was a suggested crackle solution).

I'm going to try removing effects and plugs ins to see if that makes any difference. In the meantime any advice greatly appreciated.

Could it be a bad second eds card?

Thanks,  
Dan

Ooops.

Just being an idiot.

SPDIF insert with the effect switched off was the problem.

So looking forward to finally playing with two cards after the 1 year wait of trying to get this to happen and the 8 year wait to upgrade to a second card!

man, this is great news - you had me worried for ya. Crackling usually ain't a good thing. Feel the extra DSP love, it's addicting though.

Thanks for the concern and the help.  
Can't tell you how good it is to finally have that extra power. 3 or four cards (just for the extra effects) would be great!

Still, I'm beggining to think that a laptop and a focusrite sapphire pro could probably replace my somewhat unweildy paris rig (it's gets moved around 8 times a year)... perhaps a supplement to it instead!

thanks, and sorry for the false panic,  
Dan
