Don't have it, but here's what I'd try in your spot.

First and foremost, read the documents and see if there is any reference to
not working with older wrapper, and/or contact UAD support and let them know
what you need to do and get their opinions.
Create a ghost image of your current installs.
Leave your current wrapper as is except pull out any pointers to the UAD
stuff. Remove the UAD software.
Create a new folder on your C:\ drive and name it UADVST or something
similar.
Reinstall the newest UAD version/reg codes as necessary, only make sure that
it points to new VST folder.
Wrap the UAD with the new wrapper.
The old VST's are still wrapped with the old wrapper, which I'm assuming
since your on paris to be version 3.3, yes?
Rescan the configs making sure the directories are pointing at the right
folders to scan for plugs.

Keep in mind that I've never done this and this is just my first impression
of how to tackle trying to get the 2 wrappers to play nice together.

I'm referring to the one which now comes with 4.5.  Does this wrapper work
only for the UAD plugs, as I would expect?  And can it coexist with the "regular"
VST wrapper for other plugs?

Thanks
