Mike or others-

I just got going with the new drivers on my new system. Got paris up and I am installing my plugins. Question- how do I go about installing all the aftermarket EDS plugins like heart beat, etc?

I have a read me file that is directing me to copy the files into the windows\system\ensoniq\plugins but that directory does not exist as far as I can see.

Any advice?

Thanks,

Phil

Actually, now that I am looking at it, I don't see any DX or VST plugs, or EDS. Do I need to install that old XP FX subsystem thing?

EDIT-

Okay, I am an idiot, I forgot I needed to do a configuration and uncheck "disable DX" and also I needed to set the VST path. But same question about the EDS effects---have not figured out what I am doing wrong yet.

Thanks,

Phil

Hi Phil,

The EDS plugins get dropped into one of two places depending on your Windows version:

32 bit Windows: windows\system32\ensoniq\plugins

64 bit Windows: windows\syswow64\ensoniq\plugins

There is no need for the effects subsystem update or path changes. They are built into the installer.

Cheers!
Mike
