>It works for some folk, not for others. Drunk-ness, that is....

I loved that town when I was there....but that's another story.

I think that sweet, beautiful place could have been slightly better prepared. Sometimes being the most laid-back place in the country can wind up bitin' you in the ass...

Please, I do not mean to offend. I am a poor person with no pretensions. I just notice how some folk are a little more pro-active than others, that's

all....

It breaks my heart to see all that suffering. I just go numb. And angry.

Jimmy

>That's what I'm not sure I understand (having not seen the relative figures). I've heard that said about inflation, but it doesn't seem to coincide with other prices and wages. Oil jumped from about \$14/barrel to \$37 or so due to the Iran/Iraq war from 1978 to 1980. That was a 160% increase for that time, and the equivalent of \$86/barrel today. However, that was an event spike, not a normal inflationary increase, and it spurred a push in the 80's for more energy conservation (i.e. consumption went down, relative to growth by something I

ike 20% didn't it?). Inflation hasn't risen by that much since 1978. I look at salaries when I graduated college relative to now (same profession, starting salary) and those also haven't increase 3 fold - actually not even 2X. By 1986/87 oil prices had dropped back well below 1980 prices (close to \$14-\$20/barrel). In looking at the general 20 year price trend, there isn't a 4X increase in any market I know of. Wasn't a gallon of mild about \$1.00 around 1980? It's \$2.79 now - 279%. We are looking at an over 200% increase in oil prices in a year, and 4X since 1986 (7X since 1998, but that low wasn't a norm). With gas now predicted to top \$4/gallon, that's well over 200% in a year at the pump too.

In 2004, Principal Global Investors' economic report cited the rise to \$44/barrel as a disruption (comparing the 1973 to 1974 rise of 269% as a "shock"). They did however propose that the resulting economic recessions

of 1974 and 1980-81 were a result of spiking interest rates, not the oil price spikes. I could see the same happening now. However, it seems to me that interest rates are set as a reverse reaction rather than stimulus proaction during economic burdening events (oil price rises, etc). While investing takes a hit during low interest rates, housing booms. When interest rates soar, housing crashes, as well as some businesses. Loans are more of a burden on the economy than investing is a boon, at least in my unqualified opinion. That may be a bad indicator of what the economic basis is, but it seems more of our reality than not.

We seem to be on an exponential increase with oil now spurred by events rather than inflation. Such a spike is similar to '74 and '80. I just hope the results aren't worse.

Regarding alternative energy - you are quite right (and I also know you are more informed about the oil industry than I am) - we do need to bite the bullet and start moving to other sources. I know there are hydrogen fuel cell cars on the near horizon - some manufacturers have started previewing them in ads, but obviously fuel sources and distribution are a huge limitation. I'm not psyched about extending the life of nuclear power (esp. into cars). It isn't a long term solution. IMHO, the long term risks (waste disposal more than meltdown risk) are just as high as depending on oil.

At least maybe this rise will get us moving towards something else - anything else. My mountain bi
