For some time I've used an old MIDI program and interface (Vision/Studio64X) to create drum loops. Lately, I want to incorporate those loops into Paris projects. I've figured out how to import them onto the Paris playing field at track 19 and I've got Paris triggering the MIDI from there, but what's the best way to convert the MIDI track to an audio track? Would just "Bouncing to disk" do the trick, or is there another way?

Many thanks!

Richard

It's my understanding that Paris' midi functions are as useless as tits on a bull...I would suggest finding another means like a second computer linked in any fashion to get your midi converted to audio tracks into Paris

If you are monitoring the drum samples through paris, you would need to

"print" the drums via that track.

I would try to separate the individual drum sounds somehow during that process.

Best,
Lance

The way I used to do it was to route the outputs of my midi sound module into a record enabled Paris audio track. then, but muting allof the midi tracks but the ones I was bouncing to the respective audio track, I could bounce 2 at a time this way until I finally got all of my midi drum tracks recorded as audio tracks. I did this for quite a while actually, until I finally broke down and got myself a 2nd computer and started syncing it up via ADAT.
