Is there a bug (feature) associated w/ the Automation Edit window that I've forgotten about? I was working on a project yesterday and almost everytime I either switched views or closed the automation window Paris crashed. It's been behaving so well lately that I was shocked! It's an old ADAT transfer project so it's 48K sample rate. Might that have something to do ith it?

I need to figure it out so I can finsh mixing this darned tune!

Thanks,

gantt

That's Weird. I don't know of any bugs like that. I don't do 48k that much though, but it shouldn't make a difference. If anything, I'd think 48 would be more stable since that's kind of what Paris was designed to run at. Sounds like it may a vid card conflct or funkyness.

Yes, it is weird. I don't do 48K much either. It frequently stops "to reset hardware parameters" when I'm in 48K and makes occasional funny noises, but this is a new one on me...

I had this problem on a couple of occasions and it turned out not to be with the automation window, but in the edit window where I was punching in freeform mode, and hadn't closed freeform mode before saving & closing the project. Could this be the case in this instance?

No, I don't think so... I'll check, but I 'm fairly certain that the edit window was in 'constrained' mode.
