I listed this as an alpha because as far as supporting PARIS OMF files, that seems about right. It opens some PARIS OMFs, omitting track names/region names/framerate/tempo. I wouldn't call it \*useful\* right now, but it's certainly intriguing, and more exploration is coming. See this thread - <http://forum.cockos.com/showthread.php?t=24943> - for details (starts around post 121)

Unsticking because 1) we already have this functionality since AATranslator does this beautifully now and b) nothing seems to have happened at the Reaper Forums with this extension for a long time anyway.

[erm... as soon as I find the "un-sticky" button... ]
