I imported the tracks into wavelab and had the same clicks. I don't think it's heat. Side of computer is open to cool room. Could be power related, though it's wierd that it just happenend after all this time.

More wild speculation....

If you are recording and your computer is close to 100% CPU power the simple checking the cdrom drive can cause clicks and pops at regular intervals...Also if a hard drive is sharing an IDE channel with a cdrom and it checks for a cd in the drive then that hard drive cannot be accessed

But would this only affect certain tracks or all track? My current project is nine tracks. and only three are affected. And the old question of why now all of a sudden after all these years? I'm gonna try pulling out one of the eds cards to see if it's a power issue (I'm guessing more power will be available to remaining eds card). If all is well with one eds card what are my options ? I have a pretty beefy power supply in it now. I guess I could try to get an expansion chassis.

i had this happen years ago and it was the power feed to the cd drive.

this was the beginning of the end for the ps. for a temp fix try switching the power feed to the drive or disconnect it.

I seem to have discovered the trouble. While mixing my last album I had to get a new dual head pci card. (old matrox agp card died.) Well it was no problem mixing but it didn't like it when I started tracking pre pro for our new cd. I bought a ati radeon 7000 agp card to replace the pci card and all seems well.

I am thinking of getting a used magna pci to pci expansion chassis so I can add two more monitors and maybe a third eds card.

Thanks to everyone who offered there help. I hadn't been to this newsgroup in quite a while and I was pleased to see I wasn't the only one in the world still going strong with paris.
