Hi guys

Is there any advantage to having a dedicated midi / vst rig which outputs it's audio via whatever means (analogue or digital) to an audio rig assuming they are both sync'd

Biggest hassle is having your song saved in two places. Aside from that, it's all pluses for me.

'Course it depends on what you mean by two rigs - if we're talking about two separate physical machines then the added physical space can be a concern, as well as added heat and power draw (all three would be in my space). I do my "two DAW" thing on one PC - I also have my dual G5 Mac in the machine room and switch between Mac and PC via a dualhead KVM, and there's no way I could fit a third puter in there.

Biggest advantage is that PARIS stays around for what it's particularly good at. Still sounds better than anything else I could realistically aspire to.
