Hi. I'm on Windows XP and PARIS was working fine until just a couple or so months ago. Now when it starts up (or even if you just start a new project when already in PARIS) it takes several minutes. The splash screen and the start-up bits when you see the splash screen are fine. It's after the splash screen finishes, and just as the Project window comes up; at that time, the Project window just sits there, half-displaying (i.e., not all graphics show, just a couple menu options and a blank window) for several minutes. Then finally it comes up fine. I have tried disabling all plugins, that has had no effect. The hardware seems all to be fine. Once up, PARIS works just fine, no other anomalies. Any ideas? Thanks much.

Wilson,

Temporarily rename your default project and startup without one. Might be something in it has been "pooched".

Hi,

I suspect you have installed many plugins so Paris needs time to read all them...

See if when Paris hangs if it says DX plugins/vst whatsoever...

Not really the same problem, but I have noticed on my XP system, that if I start the comp up and go do something else for 10 minutes or so then try to open Paris, Paris starts its thing then crashes at the end. and then I have to restart the comp but if I start my comp and start Paris almost right away, no problems.

Strange.

I run Paris on a Mac, so this may not be helpful, but I found that Paris was taking forever - I mean FOREVER! like 6 to 7 minutes! - to load the Waves plugins. Then one day I optimized my boot drive and Paris now boots in about a minute.

No, as said it is past the splash screen, so not in the loading phase. Please note also that I disabled all plugins and it still does that, so I think that would rule out that it's the plugins.

It's slow even if I open a regular project that predated the problem, in which case I would think the default project wouldn't be touched? Anyway, I did try it, I appreciate the idea, but it didn't fix it.

When you say "optimize", do you know if that's similar to defragmenting on  
Windows? Anyway, that's definitely a good idea (to defrag, at least), so  
I'm trying that as I type this, will post results.

Yes - Optimize and Defrag are the same, I think. Most folks say DON'T defrag  
audio drives but DO defrag system drives every now and then.

If you wanna forget all these problems try these two things one at a time.  
First of all COPY your entire Paris emu folder in c:\ root with a simple  
name like Paris.  
Start your Paris exe with a shortcut from the new directory.  
You don't have to delete the old one.  
Just make sure you are opening the Paris from within the c: root directory.

Secondly DISABLE Directx !!  
What a relief, no crash for months.  
For DX support just put your FFX4 free chainer wrapper in your vst direcorey  
and thats it.  
Regards,  
Dimitrios

Just FYI I have tried these on my system for my problem, no change. I realize you are addressing Cujo, just saying for the record. Appreciate the input/info.

Pull up task manager before launching Paris, see if there is any foolishness going on with RAM or CPU, and look at what process/app is causing it. Might be some clues there man.

Nope, the defrag did not make any difference. Thanks for the idea. Still takes 5-6 minutes to load.

Have you tried a zip/rar backup of the whole Paris map, then uninstall Paris and everything in that map, close down the computer and start it again and

start up a new Paris installation to see how the new one works when restarted? If you need some files from the old installation, just import it one and one from the zip/rar archive and test what's happening. That way, I think you can eliminate if it's a problem with the Paris software.
