Hi

Anybody would be interested by adding third party apps to the Paris system ?

Thru the existing DLLs exports, it seems quite makeable.

I'd like to make an app like bidule or reaktor (in smaller).  
which can take vsts as internal modules, and uses the Paris drivers to handle the audio data and play with all these esp2.

I have the necessary code in my c++ libs for such app.  
So i'm talking seriously  
The only real trouble is the Paris integration (with dll's h files it'b be real easier though), there I have nothing.

Any feedback ?  
Any idea for more Paris apps ?

That sounds really cool actually.  
That'll be something I'd be interested in assuming it runs stable with low latency.

As of ideas for apps, I'd say finding a way to make routing between cards possible would be incredible.

The Paris Asio driver would be a big deal but it's still in beta.

A convolution EDS reverb would be great but probably not possible
