Just announced today. Anyone actually seen one?

Looks nice.

Haven't seen it in person yet. The big news is the new case construction. If it's even more rugged, great!

But I'm glad I didn't wait to get my 17", since, for now, that model hasn't changed (except for some new drive options).

As for the 15" model's other changes, on the one hand, black around the display could be an advantage, perhaps less distracting for graphics work. OTOH, it looks weird on first glance since the body finish is still metallic. They also dropped the matte option for the display, which is my preferred option.

Dropping firewire support for the non-pro MacBook is also a surprise, and not a good one.

So I'd have to give today's announcements a mixed reaction.

Cheers,  
-Jamie

Hi Jamie,

Will also have to see how the no firewire on the mac book plays out.

Sense it does not have an express slot there will be no chance of adding one.

The 15 MBP 15 only have the 800 firewire port.

Intel is pushing them away from firewire i think for USB and for the upcoming USB3.

Virtually all of the new mid-priced and low priced PC notebooks which what the Mac Book and Mac Book pro are made do not have firewire on board.

Intel has actually made it so that on the new chip sets you would only be able to add firewire via express slot device.

Much like the internal wireless cards.

At least the 15 MBP like the many of the PC notebooks have a express slot so you can add a express firewire card.

The new LED screens are fricking cool.

Can't wait to see the new LED LCD Cinema Display/docking station they are making for the notebooks.

Chris

True. Which means I wouldn't be able to use one of those with my current studio audio interface. But I could use it with my portable interface which is USB.

> The 15 MBP 15 only have the 800 firewire port.

It can do firewire 400 with an adapter. But I gotta say having both ports on my 17" MBP has been useful.

> Intel is pushing them away from firewire i think for USB and for the  
> upcoming USB3.

Here's my armchair quarterbacking (disclaimer, I'm not a quarterback and I don't actually have an armchair): It can't cost that much to include it. If I were Apple, I wouldn't make the change before USB3 is

available. I could see making the choice when they could include USB3, but dropping FW altogether now is an odd choice.

Unless they want to push Final Cut/Motion people toward the higher priced MBP now that the graphics are improved in the MB. A blatant marketing decision if so.

> Virtually all of the new mid-priced and low priced PC notebooks which  
> what the Mac Book and Mac Book pro are made do not have firewire on board.

So Apple had a competitive advantage, but now they've given it up...

> Intel has actually made it so that on the new chip sets you would only  
> be able to add firewire via express slot device.  
> Much like the internal wireless cards.

Hmmm, so it's really Intel's fault? Too bad Apple doesn't design their own motherboards any more...

> At least the 15 MBP like the many of the PC notebooks have a express  
> slot so you can add a express firewire card.

Yep. And they also have onboard FW.

> The new LED screens are fricking cool.

Have you seen one in person yet? The LED screen is decent on my MBP.

Hey Chris,

Speaking of Firewire, my new Dell doesn't have it. Any 'gotchas' about PCI-X firewire cards? That's what seems the most logical giving the various other slots that are already filling up.

TCB

Looking at the MacWorld quick review -

[http://www.macworld.com/article/136063/2008/10/macbook\\_first\\_look.html?lsrc=top\\_1](http://www.macworld.com/article/136063/2008/10/macbook_first_look.html?lsrc=top_1)

- I noticed a very cool improvement in the MBP. The hard drive is easy to access and easily user-upgradable. That is something I wish my current MBP incorporated. Glad to see that change.

CNet has a pretty good description of the new trackpad/button design:

<http://reviews.cnet.co.uk/laptops/0,39030092,49299367,00.htm>

I'll have to try it but it sounds like a good idea. The way the trackpad and gestures works on my current MPB is also well thought out.

Cheers,  
-Jamie

Hi Thad,

Do you mean PCI-x or PCI-e for a firewire?  
This a desktop or laptop?

Here are the ones we use that seem to be compatible so far.

PCI-e cards

<http://www.siig.com/ViewProduct.aspx?pn=NN-E20012-S2>

[http://www.sonnettech.com/product/allegro\\_express\\_fw400.html](http://www.sonnettech.com/product/allegro_express_fw400.html)

Express card

<http://www.siig.com/ViewProduct.aspx?pn=NN-EC2012-S1>

<http://www.startech.com/item/EC13942-2-Port-ExpressCard-IEEE-1394-Firewire-Card.aspx>

Yes that is very nice. But hop you never need to change or upgrade you ram. It is located underneath the keyboard.

You need to dismantle the whole laptop to get to it.

Not there choice to make. It's Intel's choice. They see no point probably in spending time on some thing that 0.5% of the consumer/business market use.

If not including means low power and cost then they will ditch it. Of course Intel is one of the main people behind USB so who knows what their motive is.

>  
> Unless they want to push Final Cut/Motion people toward the higher

Yes they do want the "Pro" to use the MBP and I think they want them to just use the 15' and then buy that the LED display for it to edit with so they don't need to bother with a 17" model.

Apples market growth is in the consumer world so expect to see them paying less attention to the "Pro" market. Those people only buy computers every 3 to 5 years. \ Apple would be out of business if thats the only market they had. :)

Apple is at the mercy of Intel as much as any other computer manufacturer. If you go the local Best Buy and look at all brand new low and mid priced notebooks you will that they are basically the Mac Books sans the fancy touch pad and LED screen.

Apple's computer parts like everyone else are made buy a handful of Chinese and Taiwanese manufacturers. Quanta and Foxconn being the main ones that work with Apple.

Apple has a fab plant that they got from HP to make the MB and MBP but that is for machine the snazzy cases and assembling the parts.

Not sure if I would say it's Intel's fault. Probably a smart business plan for them who ever buys their stuff.

Remember now people have to come out with USB and express card based video and audio devices to replace firewire ones.

Which people need to buy now if they want a new Apple and for that matter Dell system. Isn't capitalism neat.. :)

Not the new ones and the ones that do are using extremely shitty ones.

Not in the Mac s but have seen the technology they are using already.

I mean PCI-x on a desktop. I know, it's weird, but that's what I'm stuck with.

The MBP hard drive's not that hard to replace..  
I did it to mine, (put in a 250gb) and it only took an hour...if I knew what I was doing it would have been under half an hour..

That's good to know. Do you have have a good link for instructions to follow?

I expect to do it eventually, either to put in a bigger drive or perhaps a solid state drive. Won't need to do it for a while, though.

But with the newest MBP design it looks like it would take less than a minute. With that setup, I would consider changing out the drive much more often. For trips, for shoots, for gigs. That's a useful improvement.

Yep, the 15" is a more portable package. My old PowerBook is a 15" and I like that size. But I am enjoying having HD video resolution wherever I am with the 17" - it rocks. It's been worth the small extra weight penalty for what I do.

OTOH the pros buy the big iron and pay the big bucks. :^)

Heh. Good old planned obsolescence.

That's something I managed to avoid with audio interfaces after PARIS by buying a FW audio interface instead of an internal-card-based one. My FW interface has lasted through three computers, not bad. But it wouldn't work if I got the new MB.

I'm just starting to think about express card add-ons for my MBP. Do you happen to know if anyone make an express memory card that's fast enough to keep up when recording DV or HDV to a tethered MBP?

Cheers,

Hi Jamie,  
When you say express memory card do you mean a solid state disk?

Chris

Hi Thad,  
Oh ok. Its an old Dell Xeon system?

The only direct PCI-x firewire card I know of is this one.  
<http://www.sonnettech.com/product/allegro800.html>

Not sure if it works well or not.

Most current 32 bit PCI firewire cards should work in the PCI-x slot.

Hi Jamie,  
Sent you an email about changing the drive.

Chris

Not 'old per se, but yes a Dell quad core Xeon system. It was cheap and the chipset is reported to play nice with my Pulsar card. And I got a deal because I'm an educational buyer.

I've never tried the PCI card in PCI-X thing. It just seems backwards to me as a geek, but I probably shouldn't think that way. God knows there are enough 32 bit PCI firewire cards out there.

TCB

Yes. Looking around on the net I've seen them up to 16GB so far, but I'm not sure the ones I've run across would be fast enough to keep up.

Hi Jamie,  
The fastest SSD drive which is being made by Intel atm is about as fast  
a ata 133 drive in actual performance.  
The life span of SSD drives is also lower than standard hard drives.  
It might be able record a few tracks though. They are very expensive  
still though.

You can get a 2 port Esata express card and use external Sata drives get  
far greater performance for the money.

Chris

Is this in express card format or a solid state version of an internal SATA drive?

What I'm wondering about are removable solid state "drives" or flash cards that plug directly into the express card slot. Express card media.

Here's an example I found (32GB), but I don't know if it's fast enough for direct video recording on the laptop (camera connected via Firewire):

<http://ec.transcendusa.com/product/ItemDetail.asp?ItemID=TS3 2GSSD34E-M>

- > The life span of SSD drives is also lower than standard hard drives.
- > It might be able record a few tracks though. They are very expensive
- > still though.
- > You can get a 2 port Esata express card and use external Sata drives get
- > far greater performance for the money.

True, and that may be an option. The drawbacks are that external hard drives are bulky, make noise, require connecting with cables (possible points of failure) and are somewhat fragile for on-location use. Which is one reason I'm curious about the current state of solid state express card drives.

This would be used for video recording via Quicktime Pro or with dedicated video recording/monitoring software like Scopebox. One situation where direct laptop recording may make sense is when doing interviews.

Cheers,

Dropping FW was a very bad decision IMO. I have no use for a laptop with out FW.
