Everyting worked fine when I had ME loaded. Last week I changed my computer
from ME to XP and all hell broke loose with my Paris setup. I Downloaded
the XP driver and I everytime I exit Paris, My system reboots. It tells
me Paris has encountered a serious error and reboots. I have read and followed
the install instructions and something is still not right. Maybe Im doing
something wrong because I not really a computer person.

I am running a dell intel pent 3, 1 gig , 512 ram, 3 paris cards

Morgan tried helping me, but right after I got off the phone Paris really
went wild. Please Someone call me at 703 597 7825 on my cell phone and walk
me throught this.

If you didn't, be sure and install the Paris Effects Subsystem.

Now only that, but when you install it, make sure the install path matches
your Paris install. If you're on version 3.0 and it's installed under C:\Program
Files\ then it should default correctly, but if it's on another drive, in
another directory, or if you're running version 2.2 or earlier then it wont
default correctly. Not only that, but when you choose the path and click
"OK" or whatever the button is, it will then change it on you and you'll
have to change it back in the text window which shows the path before continuing.
You have to watch it closely...

Cheers,
Kim.
