I have an older Toshiba P25-S477 that had been my gigging computer.
P4 2.4. Primarily using PCDJ software with the onboard soundcard
along with USB audio drive.

It just wouldn't get to Windows so I bought a new Toshiba hard drive.
It worked perfectly the next gig and then the exact same symptoms
from then on. I replaced the whole laptop just to get by on my gigs.

What else should I be looking at to sus this problem out? I tried ram,
OS drive. My computer shop tried battery and power supply. Is it =
possible=20
it's the mobo battery? I'm hoping for something simple. It has a sweet
17" widescreen that I hate to part with.

I choose Polesoft Lockspam to fight spam, and you?
