Howdy, guys. Long time no see, again.

Swen had some playback problems with a large project, so we stuck some extra
RAM in there, which seemed to help. Problem was, later last night we started
getting some really nasty "digital tearing" sounds out of his rig. The fact
that he had been rooting around in his comptuer case like a bear at a garbage
can while installing the RAM makes me suspicious that he caused some hardware
problems with his carelessness. Anybody ever had any "digital tearing" sounds
come out of their system?

Jimmy

No. But if you go messing around in the case much - I had to dive into a
"cursed Mac" issue for a friend once. The Mac worked but had odd "issues".
They'd sent the mobo for servicing twice. The first time they replaced the
processor and the second time they replaced the whole mobo. Then my
despairing friend let me have a poke around in it,

Within minutes we'd found and replaced a "not quite broken looking" ribbon
connector that had got just a tiny bit "kinked" = not even at a full right
angle - when it got caught on something during some of the "poking".

With that, the problems were cured.

So if you do much poking around in there, don't entirely rule out slightly
damaged ribbon connectors as potential culprits. I wonder how many "cursed"
computers have been written off because of them?
