Looks like he needs some real asborbers as apposed to the aurallex stuff he has...bass traps wouldn't hurt either

Realtraps : <http://www.realtraps.com/>

Ready Acoustics: <http://www.readyacoustics.com/>

Modular Acoustics: <http://www.modularacoustics.com/>

John L Sayers Acoustics forum: <http://www.johnlsayers.com/>

Recording.org acoustics forum: <http://www.modularacoustics.com/>

General info: <http://forum.studiotips.com/>

Bottom line here is if you can find 3" rigid insulation (olive coloured) wrap it it a light cloth and hang the panels in the room roughly 3" off the walls and ceilings you'll save yourself a ton of money.

cost for my layout was a little over \$500 CDN

Yes please Don,
Photos would be great.
3" rigid insulation What's t5hat ?
Is it the fiberglass ?
We have here fiberglass and stonewool.
Can you also suggest as where in the room put which ?

I know he needs at sides in the control room some absorbers, right ?
What about behing (in front) of his speakers ?
Is this foam ok that they have ?
Thanks for your suggestions !
Regards,
Dimitrios

Wrong big time! regular foam does next to diddly squat in terms of absorbing frequencies and killing reflectivity

>you need mass to absorb low freqs efficiently -

No - you need mass to reduce sound excaping a room...as in creating an iso booth...

> little bit better approach (if you don't want to build actual
> bass traps) would be to glue it onto MDF (medium-density
> fiberboard), THEN wrap that in some fabric for appearances'
> sake.

Wrong again...the fibre board actually reflects the sound before it get a chance to be absorbed...hanging the insulation panels about 3" off the wall does wonders for abbosrbing mid frequencies and reducing the reverberation in the room.

Also, I have a few of the Auralex LNRD corner traps & I > must say they work pretty well.

If you check the corners of my diagram there are floor to ceiling bass traps and they are nothing more than two bats of insulation standing across the corner. Granted there are several variations on this theme including "tuned traps" but my panels worked remarkably well in taming bottom end issues....and a very inexpensive place to start...

>
> IMO, though, he's got a bit too much foam happening there.
> I'm no acoustics expert, but I believe in minimal treatment...

Maybe for the room you're recording in but from the standpoint of a control room the amount of insulation I used was just right...I fined the room to be very pleasing to the ear. Granted I could go all anal and get tuned absorbers and designed diffusers but this is just a home mixing room

Also since doing this treatment my mixes now translate very well across all mediums.

Carpets wouldn't hurt but once again I suggest these basic panels, if set up on stands would provide much more flexibility and controlled absorbsion than just throwing down a carpet.

Don't get me wrong here, there are many products out there that can do a much better job at taming frequencies and taming room reverberation than my panels but I'll say this...price out an equivilant set up as is in my room with either Auralex or RealTraps and compare it to my cost...my setup is far from the be all end all but it does work

Dimi, yes, it's rigid/compressed fiberglass. Owens-Corning makes it, for one; dunno if that brand is available over there, but there's got to be something similar.

What Don said about just getting some of that & wrapping sheets of it in fabric could certainly work somewhat, but no better than foam - you need mass to absorb low freqs efficiently - a little bit better approach (if you don't want to build actual bass traps) would be to glue it onto MDF (medium-density fiberboard), THEN wrap that in some fabric for appearances' sake. Also, I have a few of the Auralex LNRD corner traps & I must say they work pretty well.

IMO, though, he's got a bit too much foam happening there. I'm no acoustics expert, but I believe in minimal treatment... let the room sound like the room, just carve out the deficiencies, you know? Especially in that recording room/iso booth shot... is that wood on the floor (can't tell), and ceiling both? There might be a midrangey mode happening there; he's got no reflections from any of the walls & nothing but reflections between the floor & ceiling. If he wants a pretty dead iso booth he probably should throw down some carpet on the floor or foam up that ceiling, or both.

How does stuff that was recorded elsewhere (like a commercial CD, for example) sound in the control room? Like it ought to, or does that come out Midrangey, as well?

Neil

His room is a box -- thus, it sounds like a box. (Stick your head in a box and say "Hello" -- yeah, that sound...) Low ceiling, square angles. Yuck.

A friend of mine recently built a tiny room for a studio in his backyard. Nice little room, plaster walls, wood floor... A box. It sounded really truly awful. I suggested he get in touch with the "Real Traps" guys... He talked it over with them, bought a couple of their big corner traps, several of their regular panels, and hung them up... OK -- so -- now, the room sounds -- nine times bigger. If you close your eyes and talk, you'd think you were in a really much larger room. Not dead, not boxy, not bouncy -- just open and natural. It's the most striking example I've ever heard of the benefits of this kind of treatment.

No their stuff isn't cheap, but it's like anything else -- if you want to really deal with this problem you have to get tools that work.

Or build a better room in the first place. -- good luck with it -- chas.

Gee, good thing all my trial & error over the years has proved

fruitless when there are so many experts here.

Between not knowing how to use an SSL, and not having learned diddly-squat about acoustics, I guess I'll just drop the recording stuff & take up shuffleboard.

Or did I just drop into the r.a.p. forum by mistake?

Neil some rooms are inherently better than others because of their dimensions...this is physics at work. As for your recordings and mixing I'd also say that your years of experience have as much to do with the final result as do the acoustics of the room..probably more.

Absolutely true...and with the expanded knowledge base and new construction materials more freedom in design is available. But there are some basic physics involved that can't be altered.

I think you've heard an example of my drum setup recorded in my minimally-treated recording room, all by itself with no verbs or anything applied. I think you've also heard some of my mixes in my minimally treated control room. Anyone's personal preferences as to how they'd mix stuff differently aside, I think it's pretty evident that they don't suck.

The recordings speak for themselves.

If there was one "right" way to treat everything, then every pro studio would have control rooms of identical dimensions & treatment, and there would be only one acoustics consultant in business... the ONE guy that was "right".

Thanks all for your posts !

Dear Don in your sketch (your room right ?) there is no glass in between the monitors.

In this studio there is.

What would you actually suggest based on this very control room and recording booth ?

I am looking towards in building for him (I can actually use them too !!) these absorbing panels.

According to all these information I would try this fiberglass compressed at least 5cm thick and put two of those to have 10cm thickness and 65 cm width and 1,05 m height and have them as you said 3 inches of the wall ... Just don't know yet how to hang them from the roof, but will read further all those great sites information.

Could you make a basic drawing (I am asking too much ?) of where you would actually put them according to the photos I have posted ??

Thanks
Dimitrios

i think he was referring to OC 703-704 compressed fiberglass sheets.

Looks like there are some serious issues with which frequencies you're friend's treatment are eliminating and which are being left behind. The foam is pretty useless below 500 Hz, and below 500 Hz is where most smaller studios have the most problems. Check out the links and forums on this website:

<http://studiotips.com/>

Lots of good people hang out on the forum and they're generous with there knowledge. I agree that he needs bass trapping. Also less hi freq absorption and more diffusion. Speakers nearly on the desktop seems like a problem to me also. I'd move them up and back on stands that decouple them from the floor.

Gantt

Dimitrios,

Didn't know if you had tried it, but whether you use their stuff or not, Auralex will do a free analysis of the room for you. I sent them a diagram of the room and budget numbers and they sent back suggestions based on that budget. The important thing for mine was the location of the bass traps.

Room works great and a couple other engineers who have come in have commented on the the "evenness" of the room being a good thing.

Just a thought,

Hoov

A few thoughts come to mind...

- The acoustic space is WAY too small for that mic... not knowing the dimensions, I would estimate you have too much 350 - 500 Hz.
- Get rid of one of those desks... monitors on stands!!
- Make sure the monitors are at a right angle to your ears once they get off the desk.
- rack mount the pre, I/O etc below console height and off to the side to get them out of the way
- Bass traps in corners of *both* rooms
- Diffusor over mix position

- smaller chair (totally with Neil on this) how can you lean back while mixing anyway???
- side walls need spot treatment, use the mirror trick and place wide band absorbers where you can see the Genelecs
- Remove some of the foam from the acoustic space and add something diffuse... wood, rock, etc.

What does the back of the control room look like???

David.

Thanks for the compliment, but think about it... if I couldn't hear what I was doing, it wouldn't matter if I had one year of

of experience, or a thousand. I'm not saying: "work in a shitty acoustic environment because it's fun when you've got more of a challenge, mates!", I'm saying that you should let the room be the room and treat it minimally in terms of absorption because:

1.) You're right what you say about physics, and based on that, no amount of bass trapping or other treatment is going to COMPLETELY overcome the ENTIRE structure surrounding the space you're working in. No practical or realistic amount, anyway.

2.) Hence, there is no "perfect" environment.
(Again, if there was, every top-notch studio would have this exact same "perfect" environment, yes?).

3.) The best mixing environment is one you're used to.

4.) The best recording environment is one you know how to make work for instrument "a" or vocal "b".

5.) If you overtreat a room, you've got a room with no "life" to it. This goes for recording rooms (70's drum sounds, anyone?) AND mixing rooms (ever sit in an anechoic chamber? I've been in a near-anechoic one... your eardrums sound like they "compress" when the door closes - that, or any degree OF that, can't be good for mixing, can it?).

6.) Skip six... numerologically, it would bring bad karma to this thread.

7.) You don't need near as many bass traps as Ethan Winer & various mode calculating spreadsheets might suggest... most of you HAVE bass traps already built in... walls that are constructed of drywall with an air gap & then sheet insulation behind them fastened to the other side of the interior wall... hmmm....? Sound familiar? :) Kinda just like.... oh, I dunno - A BASS TRAP???

8.) You probably DO need SOME trapping, though, and if you can trap a little bit of bass & get rid of standing waves to the point where they'd be even as ridiculously high as -30 or -40db, you could probably get a decent mix in a shower stall - assuming you've done more than a handful of mixes in said shower stall.

9.) Bigger is better, #8 notwithstanding.

10.) Don't "overspeak" the room - if you've got a 10' throw to the room, you do NOT need soffit-mounted Westlake Audio's

with the 15" woofs... for most (not all, depends on dimensions) home/project studios I think anything more than nearfields are a waste other than to give the band something to RAWK OUT TO!, while you're tracking.

11.) I can't think of a #11... I was just on a roll & couldn't stop typing in time.

Neil

Neil, I think most of what you've said rings true, especially your comments in Dimitrios' second post above, very observant, although there are a couple of things that I will "agree to disagree with you" about.

For everyone else, I want to qualify this next diatribe by saying I am no expert in the field but I did a lot of research, spoke personally to a number of people who are a lot more knowledgeable than I am AND had the room evaluated by two companies. And between me and the fence post I came up with my basic room treatment plan.

sorry it's a little long in the tooth but I kept adding things I felt were relevant as want along and what you have below is pretty well the whole shebang (and a fun read I hope)

Now after a few months of research, asking really dumb questions, posing scenarios etc. I went ahead and bought my materials then went to town and the very first step was to rip out the walls between two bedrooms to make a room roughly 20' X 10' X 8' not exactly a "golden" room but a heck of a lot better than the 10' X 8' room I had been mixing in...talk about a friggin acoustic nightmare.

I also purchased a Hafler P1500 power amp and a pair of Notepfect Alpha Pro's from Australia (sight unseen) after auditioning more monitors than I care to remember. Everything from Mackie HR 824's through the JBL, KRK, Genelec & Quested lines etc. to B&W 800 series and all I can say was that process was an ear opening experience.

For those who might be interested in the Alpha's (shameless plug here) I can best describe them as B&W 805 book shelf speakers with the bottom end of the 804 floor model...and at 1/2 the price of the 805's I can say it was the scariest moment in this whole process but I wasn't disappointed at

all...quite surprised actually. Mike Kontor at Noteproof was dead on when he said the Alpha's will blow away the competition at double the price.

But I digress...get to the acoustic treatment....

So after construction was complete and the room painted I went about setting up my room

My treatment went up in four steps

1) the bass traps in the corners - immediately the bottom end tightened up and lost much of it's muddiness

2) the wall panels went up next and there was a marked improvement of the overall tightness across most of the frequencies and the stereo image became more focused...the last wall panel to go up was the one behind the speakers and believe it or not I noticed an improvement in the stereo imaging after it was up.

3) the ceiling panels went up last as I had left over batts I thought what the hell can't hurt if I put them at the mirror reflection points on the ceiling and as soon as they went up a bit more skewing or smearing of the mid / upper mid frequencies was cleared up as a result of taming more of the room reverb / reflectivity in the room

4) The last step was speaker placement...this was this most analytical of the process. Using a specific room mode calculator (I can pass it along to anyone who'd like it) and some graph plotting as well as talking to the builder of my speakers I was able to determine the sweet spots for my speakers AND the optimum listening position for my room...I then put together an adjustable stand set up that allowed me to place the speakers in these sweet spots and very quickly determined one was the best for my room. I then had sand filled speaker stands built and placed them into the known sweet spot. Now here's a little side note - the sweet spot was a cube roughly 12" square and by moving the speakers around in the sweet spot you can actually hear differences in the stereo field, but I digress.

The very last step was to put shelving on the rear wall and fill it up with all sorts of things to break up the sound hitting the rear wall. Did I hear a noticeable difference...not really because things went up on it over time and it's more a storage spot than a diffuser so I wasn't really expecting much from it. I'm pretty sure it didn't hurt the sound any.

Now about a month ago I spent three days clearing out the non studio items in the room and began moving panels around as well as removing some panels. During this process I was shooting my room using three different ETF type programs and my results are pretty good for the expense and work involved. One thing I did notice was when I took out the panels in the back half of

the room the sound at my mixing position started smearing again. Once they went back things tightened up...so there's my vote for treating the back half of the room.

The not so final analysis:

Overall the freq response in the room is fairly flat but there is a 5db dip between 100 and 500 and a 5 db bump between 8 and 12K at which point it starts a gentle roll off to 20K...there are a few spikes and dips across that and I will see if they are worth addressing in terms of \$\$\$...afterall this is just a homebrew mixing room. This is not to say that I can't improve on the room it's just at this point in time it's not practical...but soon.

On the downside I do have an anomaly...the sound coming from my left speaker is louder than the right...now I initially thought signal chain and tested every individual component in my monitoring chain from the MEC to the speakers including having all the components tested and everything is in proper working order so after much discussion with a few more knowledgeable people in the field I (we) have come to the conclusion that the difference in wall construction of the two exterior walls vs the interior walls, as well as the windows that are on my long wall are the main cause of the problem....the fix...well the easiest was to just adjust the volume on the amp...do some mixes and test them...so far so good but come spring I'm going to look at this and other areas (mentioned above) and see if a cost effective solution can be found.

In conclusion I want to say that my room sounds very similar to a typical control room, at least the ones I've been in...it's fairly quiet but not unpleasing and the sound is very focused at the mixing position and this was what this whole project was about.

I'd also like to say that after reviewing my expenses the total cost for the renovation (inc labour) , new speakers, new amp, speaker stands and the room's acoustic treatment came in at roughly \$5000 and the cost for the treatment was roughly \$500 although it should have been about \$1000 as I got some deals on a few materials from friends.

you may now return to your regularly scheduled programming

Neil

Nothing major in terms of disagreement

The point regarding walls as bass traps...wall mass definitely can and does effect the acoustics but not in trapping lower frequencies, at least the way lunderstand bass traps (and I could be wrong here)....and although you didn't state it I got the impression you think I have too much treatment...and compared to the minimalist approach you're probably right but after looking at my personal observations as well as the numbers generated by the room analysis programs, I believe I have most of the bases covered...sure there are a couple of areas I can address in the future but for now I'm quite comfortable mixing in there.

The other thing is the importance of experience in the equation...all things being equal a more experienced AE will always get better results than an inexperienced one...being intimately familiar with you room and your gear allows you to compensate for it's weaknesses. Being able to spot problem areas is also a matter of experience...probably the more important of the two.

Funny thing regarding my situation with the unbalanced room - it wasn't until I cleaned out me room of non essential junk, which let it breathe so to speak, that I noticed the weighting of one side of the room. So the

treatment exposed a flaw in the room that I was unaware of...which can be a good or bad thing.

Bottom line here is we all agree that Dimitrios can and should improve his recording and mixing environment and as such we are all contributing to that end.

Which further validates all my statements that followed.

So I don't know what you're 'agreeing to disagree' with me on.

Hey Don,

For the window, make a '703 insert for it. Simply cover the window when mixing. A large studio I worked at in Vancouver did this and it worked well.

David.

I'm not saying that bass traps are ineffective, I'm just saying that unless the mode calculations you're using take into account the materials & methods of construction of the room, you may think you need more bass traps than you really do in a typical modern construction of drywall/airspace/sheet insulation. In this type of construction, every segment of wall between studs is, in effect, a bass trap. Is it a super-efficient, perfectly-designed one with no leakage? Hell, no. Is it something that in fact, DOES make a difference in trapping some low end? Yeah, only problem is you still need more trapping in corners, mostly. Again, this is going to vary from one room to another, allimsayinis: You probably don't need as many bass traps as some purveyors of said items might lead you to believe, if you're working in a room of this nature.

>and although you didn't state it I got the impression you think
>I have too much treatment...

No, I don't think you have "too much" - I was just saying that

\$5 Grand & dozens of hours of labor later & you still have a problem - a kinda funky one, too (mismatched L/R db levels), plus a couple of dips in crucial frequency ranges... is that really all that much better than what you could've achieved with minimal treatment? Something like 8 Auralex LNRD's (two stacked in each corner), plus a couple of absorption panels here & there to knock down standing waves in key spots?

Now you're looking at spending MORE to correct the imbalance and wondering if it's practical to do so...? Don, I'm not criticizing you for trying, I'm simply wondering out loud if a minimalist approach might have saved you a lot of money and yielded the same, if not better, results. Like you said yourself... it's physics at work - and my contention is that no "practical" amount of treatment is going to overcome the thousands of pounds of mass in various materials that each wall is comprised of. This is why some people do "rooms within a room", and others spend more money on acoustic treatment than the building itself cost. It takes a LOT to overcome your right wall being made of brick fascia/plywood/sheet insulation/air gap/drywall and your left wall being made of drywall/air gap/drywall, for example.

Neil

That's the gameplan...or variations on that theme

:-)

I guess using the term bass trap to describe the cavity between wall studs had me confused...I'm sure some frequencies get trapped in there but I doubt it's low end.

> gap/drywall, for example.

As for me spending \$5000 to end up with a problem...that's not really accurate or fair. Yes there is a problem but it was the acoustic treatment that brought the problem to my attention. Granted, one of the options to remedy this problem is very expensive, but there are others that might tame this beast which are incredibly cheap by comparison (as in pennies on the dollar) I'll find out soon enough...either way the temporary fix is working.

As for the rooms frequency response...I'll take these two gentle 5db dips over the 20-40db spikes the room exhibited right after construction. That empty room sucked donkey balls. But as I expected (hoped) with each improvement to the monitoring and the acoustics I could hear a noticeable difference in the room. that alone speaks volumes about how much treatment was required to achieve my end.

I 'd also like to add that last fall I spent the better part of a week shooting the room with various combinations of panels in the room and without even looking at the graphs the difference in what I heard was amazing. Remember this is a mixing room not a tracking room...would I track in a room with this rooms acoustic signature...I doubt it as it's too dead

for my liking. But for mixing it's very nice.

From the outset this room was never intended to compete sonically or economically with commercial studios. It was to be a comfortable place where I could go (in my home) to mix CDs and to that end it has succeeded. I agree that to do this properly would have required tens of thousands of dollars and many more hours of research and labour on my part, so in that respect spending \$5000 to renovate and treat a room AND upgrade my monitoring system would have to be considered a minimalist approach.

So..... lessee... a 2'x4' reflector/airspace/insulator can
trap low end, but a 2'x8' or 2'x10' one can't?

Got it.

From my understanding of base traps none of those wall cavities sizes will absorb low end frequencies because there isn't enough a) volume of true dead air space in the cavity and b) depth in the cavity to attenuate low end frequencies.

Remember none of my 2X4 wall or ceiling panels are being used to trap or absorb bass - they are basically broadband absorbers for mid range and I'm sure they smooth out the rooms reflections somewhat too.

But when I use a 2x8 panel set across the corner of the room I have created a 8 cubic foot (assuming my math is correct) dead air zone behind the corner panel that is about 15" deep at it's maximum...or in effect created bass trap

Granted several other factors also determine the true effectiveness of these bass traps but the math is to mind boggling for my head right now...hell it took my five minutes to figure out the volume of air behind my corner panels

:-)
