I'm wondering if this might enhance the way Paris functions on Win XP and/or even allow for multiple ADAT modules per MEC.

I'm going to give it a try in the next week or so, but if anyone wants to Ghost their OS and go for it, I would reluctantly forego the pain.

The answer is no. When WinXP first came out I went through this. As I was beta testing the driver, I was using this and it did help back then, but on the release driver it made no difference that I saw.
