I have Cubase SX3 running on my slave computer and Cubase 4 running on my Master DAW. They are sync'ed using systemlink and I am a happy camper right now.....sooooo.....since everything is working nicely, the thought occurred to me that since I'm interfacing my Houston controller with the master DAW via midi.....and since samesaid Houston controller can interface with Cubase by it's USB port as well, it may just be my duty to interface the slave DAW running Cubase SX3 in order to see what happens.

Best case scenario.....all tracks on both DAWs are recognized in some sort of sequence by the Houston controller.

Worst case scenario.....????

;o)

Houston controls the same tracks on each DAW at the same time, you create a midi loop,
and *WHAMMMO*...

"...uh...Houston.... we have a problem.."

;:))

Actually, the USB port takes precedence over the midi ports. I had the USB

port interfaced with the slave and the midi ports interfaced with the master. Even with the Houston disabled on the slave, the midi ports would not function on the master. That's about as exciting as it got. shux.....I figured I'd at least get to smell some smoke.

;o)

I've noticed that one of our willow trees has recently moved to the left about eight feet.

MR
