A producer I work with also is a building contractor and cabinet maker. Last night he proposed to me to build us a house and recording studio on a 9 acre tract of land that he has located in this area south of where we live now. We would share ownership of the property with him carrying the note for our portion and he would build a big barn on the property for his contractor office and woodworking/lumber storage. this would also be perfect for our horse operation as they would have plenty of pasture and space to \*be horses\*.

The house and studio would be separate buildings. We would want the studio to be build in such a way that if we ever sold the place, it could be easily converted into a separate guest house so it will have a bathroom and a kitchenette. I'm thinking of a control room, main tracking area and an iso booth. We could mount glass where necessary for visual reference and this could be removed and rocked over if the place ever sold and was used for a guest house.

Tight now we're renting and though there are advantages to this (as in we get to write off almost the entire amount on our taxes) there is no equity being accummulated. this proposal would basically provide us a no money down scenario to get into a brand new house and studio. If the numbers work, we could pull it off for around what we are paying right now for rent.

I need some sources/ideas for such a situation. He understands the basics of that I need because he custom build the goboes/acoustic treatments I'm using here and he met with fellow Parisite and studio construction guru Emmitt Siniard when he came out here to help me set this place up when we first moved in. cost effectiveness is a big concern here. any ideas would be much appreciated.

Thanks,

Deej

Your biggest issue will be with doors and sound-lock type spaces... but it could be done. You will probably be looking at a single concrete pad design, with individual rooms being built within. If you put the pad in properly, and make sure it is a decent thickness, you will have no

need to float any floors or walls. The layout of such a studio would be awkward for a normal living space, but it could be done.

The control room would be the main issue. In order to make it "convertable" you would have a rectangular room. The acoustic treatments could be made to be surface mount rather than built-in. Things like bass trapping would be your biggest space loss.

Your biggest benefit here is the rural setting... you don't have to worry about buses and trucks and other urban noises coming in from outside, so your walls and windows would be easier to construct.

What kind of dimensions were you considering for the building?

David.

<http://www.johnlsayers.com/phpBB2/index.php> - studio design forum

<http://www.recording.org/modules.php?name=Forums> - acoustics forum

<http://forum.studiotips.com/index.php> - more acoustics

<http://www.bobgolds.com/> - some other info including Sabine tables

these should get you started...and as always books by Alton F Everest on acoustics are the bibles

if it's a new pour i would have all the rooms isolated with a 4-6" gap between the slabs. at least that's how i did mine so each room has virtually no contact points with the adjoining rooms. i also use ball and sockets closers for the double doors for each room.

This site is a goldmine for studio design. When I built my 600 sq ft studio  
I used info on this site a lot.
