Hello, I am at a loss....I forgot to turn on one of the two Mecs I had used for a project and prompted some sort of error in Win10.
I now get a cache size configuration missing error message when trying to open the program with Paris.exe
It automatically appears to have wiped my Paris.cfg file, which is now blank when opened in notepad.

Thanks for any help, I am right in the middle of a project that had been going well...
All best to all,
Ben

This has happened to me several times.
I always keep a backup of the .cfg file on my desktop.
Look through your PARIS installation folder. You might find a file called Paris.cfg_bak.
Open it up in a text editor and see if the parameters are there.
Rename it to Paris.cfg and replace your empty cfg file with the .bak file.
Before doing so, open the existing .cfg file to make sure it is indeed blank.
If you have no luck, I can send you a basic .cfg file, but you'll have to edit it using MS Wordpad or Notepad, according to your configuration.
Cheers,
Kim

Thanks you Kerry!

I had also written to Mike Audet, who gave me the same info..I am sorry you had the same issue, but am glad it was only a minor inconvience for both of us!

With best regards,
Ben
