Hello there Paris family,

I've almost got my Paris system running but for some reason, any audio I import is distorting during playback, even at unity.

When I try to use EQ, I also get heavy distortion.

I'm hoping this is a software problem but have a feeling it could be damage on my EDS cards, what do you think?

I can provide audio samples, if necessary. I should add that I only get the distortion during playback, when I render files, everything seems ok.

Any help would be massively appreciated.

Leigh

Hi Leigh,

I suspect that you are importing audio that has extra data written on it.

Find a copy of stripwave and see if that cleans up your audio for PARIS.

It has been a valuable tool for me.

Cheers,
Kim

This is also a very useful free utility. I think it strips the header info as well, from memory. (But can't be sure). It has batch processing too. I think Stripwav costs \$25 to gain full batch processing. (Still a bargain).

I just remembered that if you turn the monitor knob above 0 you may get distortion on playback.
